Zooplankton are an important food source for fish, like the endangered delta smelt. We use stable isotope analysis to improve our knowledge of the planktonic food web in the San Francisco Estuary (SFE) and gain insights into its evolution over the past 4 decades.

**2 main objectives:**

**Objective 1:** Analyze effect of preservation method on zooplankton stable isotope composition.

**Objective 2:** Use historical zooplankton samples to characterize trends in their trophic ecology and/or biogeochemistry of the SFE ecosystem.

The map displays the San Francisco Bay Area and surrounding regions. A legend in the top left corner identifies sampling stations: red diamonds for Objective 1 and yellow diamonds for Objective 2. The map shows the Sacramento River flowing into the bay, with stations 54 and 92 marked. Other labeled locations include San Francisco, Richmond, Stockton, and Tracy. A north arrow and a scale bar are also present.

**A.** Zooplankton identification, sorting, and picking up of 8 different species (from 30 to 400 individuals/sample depending on species). Two stations for the historical study: 54 (Low Salinity Zone), 92 (freshwater, San Joaquin river)

## B. Stable Isotope Analysis by EA-IRMS (Elemental Analyzer- isotopic ratio mass spectrometer)

The figure consists of two vertically stacked scatter plots sharing a common x-axis labeled 'Preservation Duration (Days)' ranging from 0 to 70. The top plot shows  $\delta^{13}\text{C}$  (‰) on the y-axis, ranging from -35 to -32. The bottom plot shows  $\delta^{15}\text{N}$  (‰) on the y-axis, ranging from 5 to 7. Both plots include data points for three preservation methods: Form (blue diamonds), Fresh (red squares), and Frozen (green triangles). Error bars are present for all data points except the 'Fresh' method at day 0.

**Top Plot:  $\delta^{13}\text{C}$  (‰) vs. Preservation Duration (Days)**

Preservation Duration (Days)	Form (‰)	Fresh (‰)	Frozen (‰)
0	-32.8	-32.8	-32.8
5	-32.8	-32.8	-33.1
10	-33.7	-32.8	-32.8
30	-33.8	-32.8	-33.1
60	-33.6	-32.8	-32.8

**Bottom Plot:  $\delta^{15}\text{N}$  (‰) vs. Preservation Duration (Days)**

Preservation Duration (Days)	Form (‰)	Fresh (‰)	Frozen (‰)
0	6.5	6.5	6.5
5	6.2	6.5	6.3
10	6.1	6.5	6.0
30	5.8	6.5	5.9
60	6.2	6.5	5.9

*Daphnia*

- Initial Formalin depletion for  $\delta^{13}\text{C}^*$

- Initial depletion in formalin and frozen for  $\delta^{15}\text{N}^*$
- \*remained constant over time

**\*Correction factor  
of .6 for Carbon  
and .5 for Nitrogen**

### All Species:

(difference between formalin preserved & frozen samples)

- $\delta^{15}\text{N}$ : Limited to no impact for 6 of 8 species

➤  $\delta^{13}\text{C}$ :  $< 1\text{‰}$  difference for all species

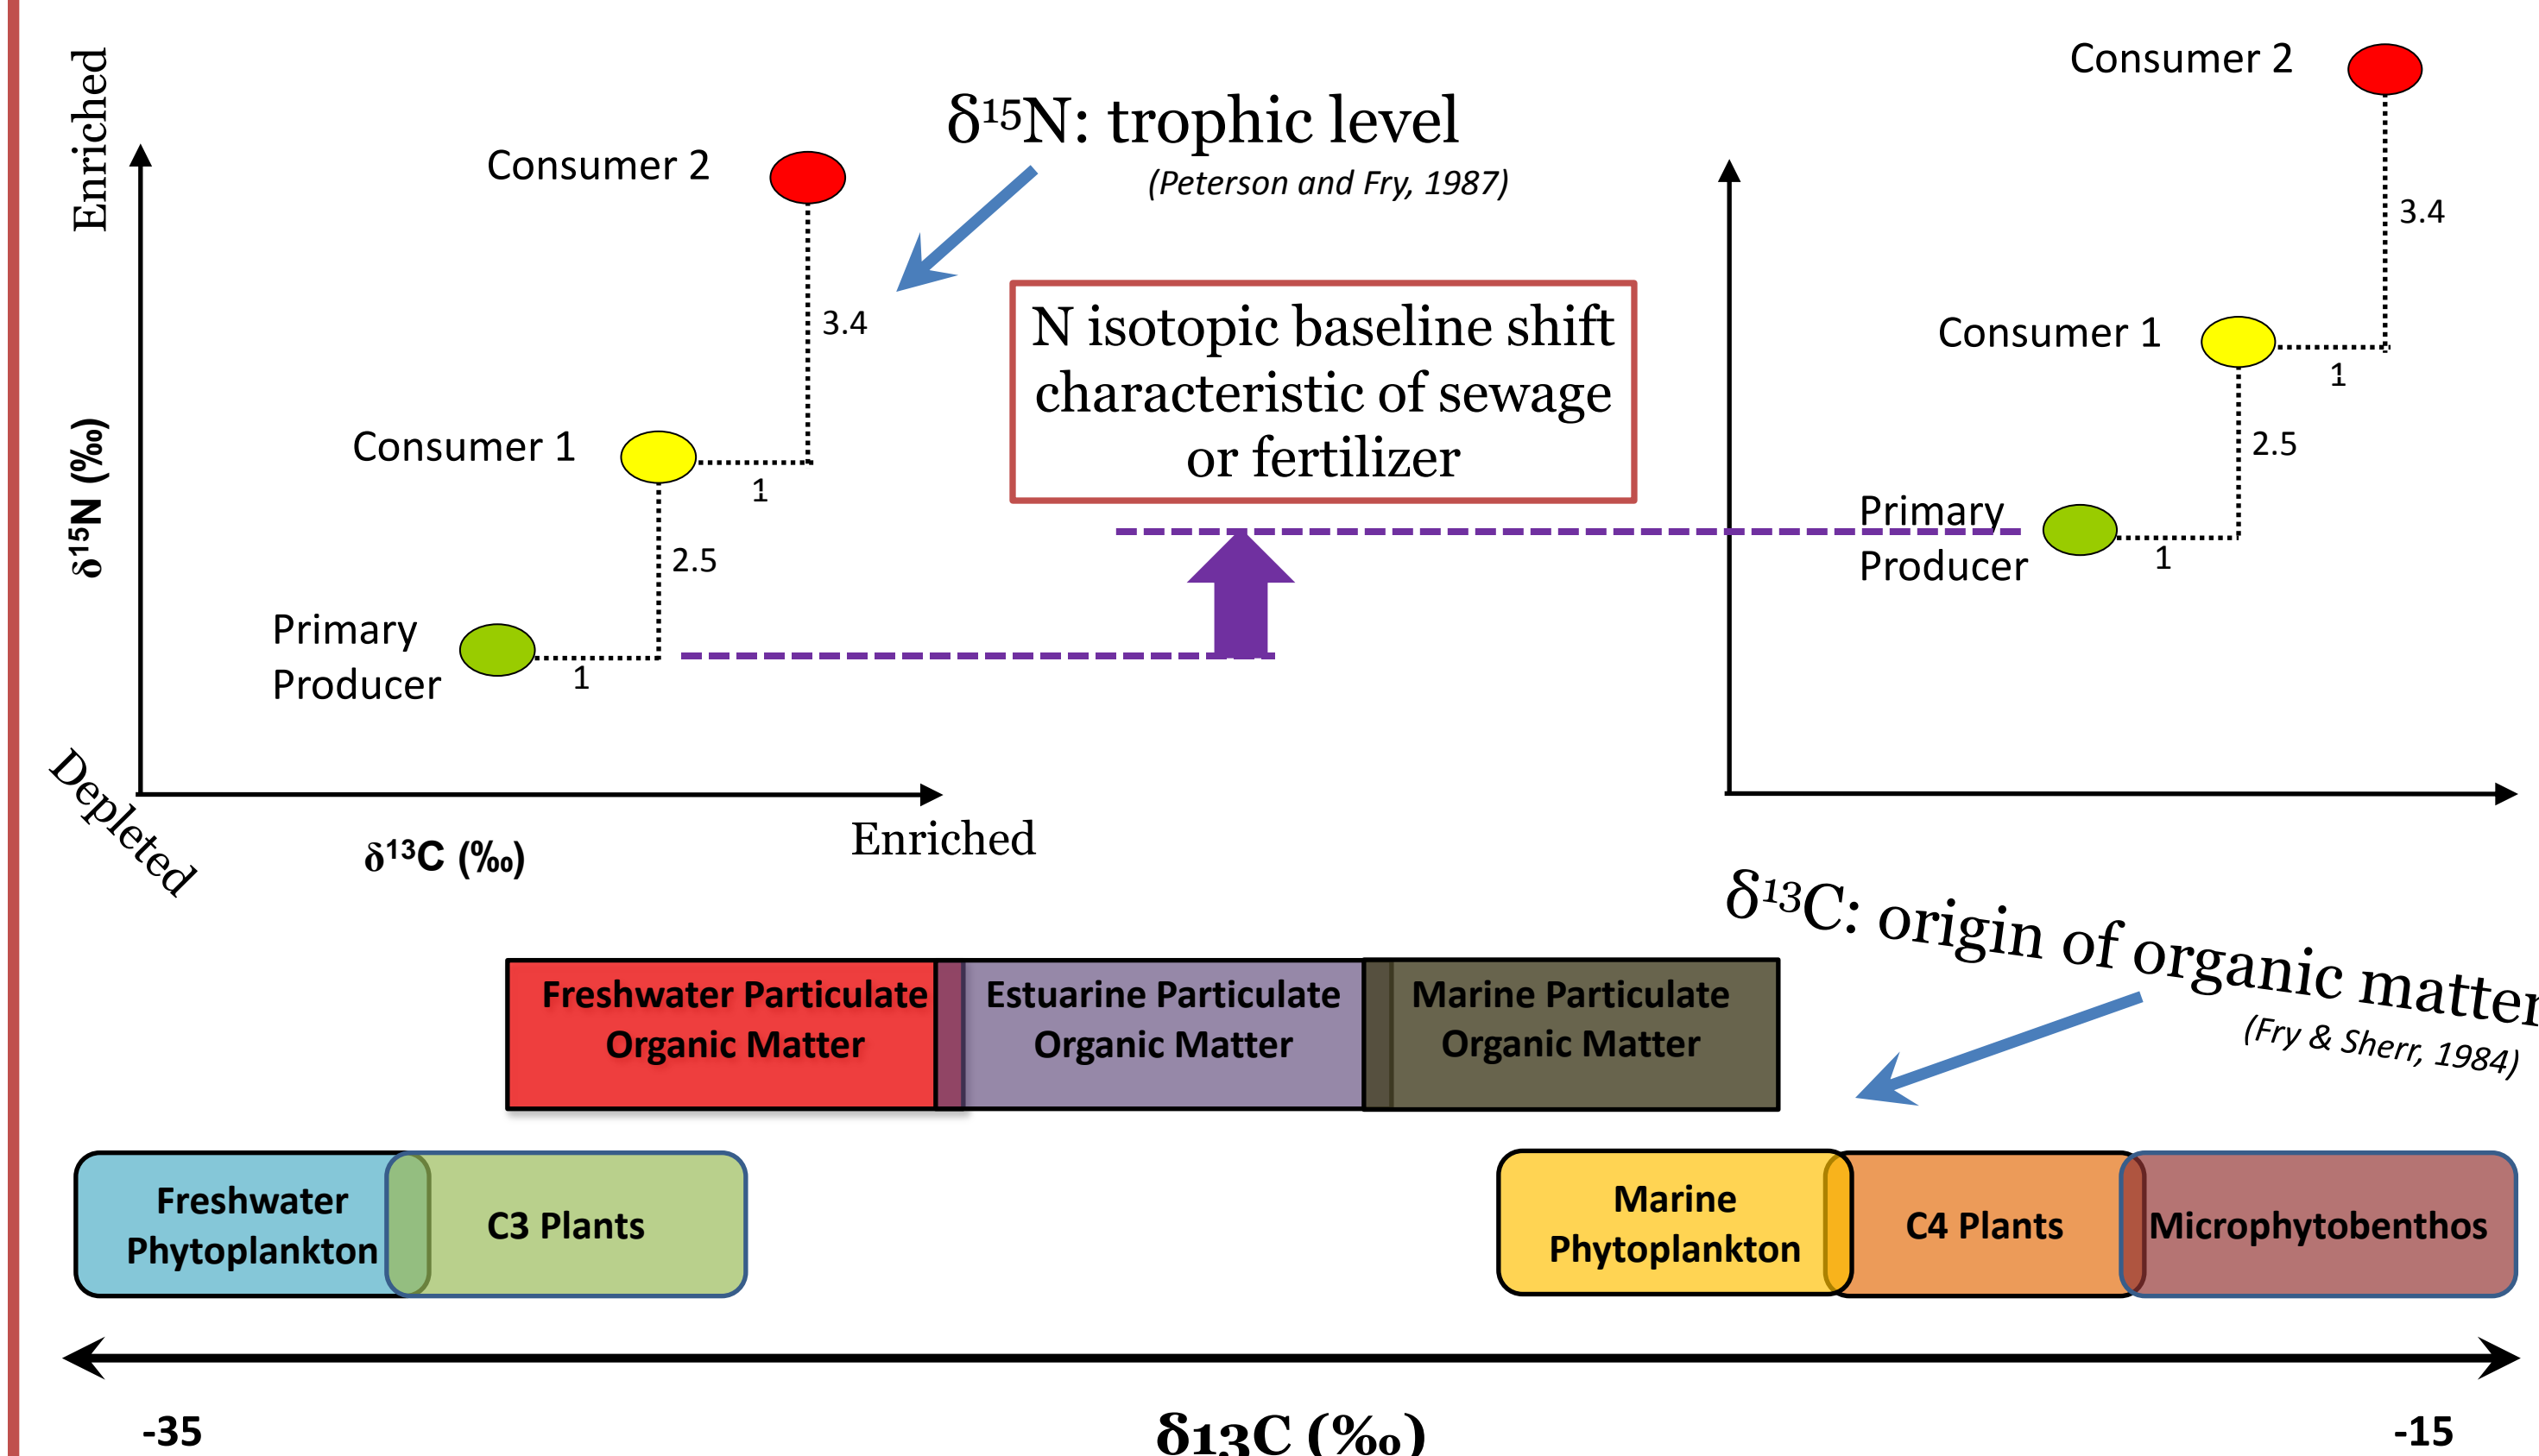

## What are Stable Isotopes?

It is harder to push the heavier Carbon 13 up the “energy hill” in some chemical reactions, which means less of the heavier isotope in the product.

## What are Stable Isotopes Useful for in Ecology?

$\delta^{13}\text{C}(\text{‰})$

$\delta^{15}\text{N}(\text{‰})$

Date

Long term mean  
 Standard deviation

➤ Carbon: some short term variability but no obvious long term trend  
 ➤ Nitrogen: values for *Daphnia* show spikes that a change in diet would not explain. Shifts may be due to incorporation of heavy nitrogen from waste water or fertilizers

★ Samples collected from station 92

- Only slight differences in isotopic signature between preservation methods (formalin - frozen)
- Like Daphnia, spikes in  $\delta^{15}\text{N}$  detected for most other species (not shown here), likely as a result of anthropogenic N inputs
- Due to zooplankton having short life cycles and frequent molts, they are accurate indicators of short term conditions in the estuary

## Acknowledgements/References

A huge thank you to all the scientists in the Kimmerer lab for all their help and for a fun summer! Thanks to Department of Fish and Game and the Interagency Ecological Program for providing us with their samples as well as the UC Davis Stable Isotope Facility for analysing our samples. Thanks to David Bell and David Morgan of the Questuary for their help with sampling.
