ABSTRACT

Oceano Community Health Plans

Phillip Brennan

Recent, mounting research shows that chronic disease, the leading causes of death and primary driver of health care costs, cannot be effectively addressed through education or preventative health alone. A physical environment that promotes health—through access to healthy food, opportunities for physical activity, quality housing, transportation options, and safe schools—is an integral part of making our communities healthier. This research and accompanying Healthy Community Plans will serve as a way for the County to begin looking in-depth at the ways the built environment (our streets, parks, and neighborhoods) contribute or detract from the health of the community. Though the creation of a healthy general plan may be unattainable for the County in the short term, a focus on a small yet cohesive part of the county presents an opportunity to affect these changes.

Under the direction of the County of San Luis Obispo Health Agency and the Health Commission, we have written Healthy Community Plans for the unincorporated communities of Cayucos and Oceano, California. Both of these plans were greatly informed by their respective communities through input garnered through outreach, interviews, surveys and personal interactions with community members.

This project examines the relationship between the built environment and public health, and explores ways planning professionals are beginning to address health issues through infrastructure, land use, creative zoning, and planning strategies that promote health and active living in policy. The planning documents, modeled after health elements currently being included in general plans throughout California, have integrated the fields of planning and public health to provide Cayucos and Oceano an assessment of its residents' health, a description of the current built environment conditions that may be helping or hindering physical activity and access to nutritious food sources, as well as establish goals, policies and implementation strategies that will set a course of action toward healthier communities.

Key Words: planning, public health, physical activity, built environment, community

ACKNOWLEDGMENTS

We would like to thank Kathleen Karle for guidance throughout our exploration of the field of public health, Chuck Stevenson for his planning wisdom and endless knowledge about the County of San Luis Obispo, and Kelly Main for her intellectual and emotional guidance throughout the process. To my project partner, Jennifer, thank you hard work and dedication. Special thanks to the members of the Healthy Communities Workgroup and our families for their constant support.

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

Project Specification

The final product of the two master's projects was the creation of individual Health Plans for the communities of Cayucos and Oceano, California. The Health Plans are attached to a single background report covering literature on public health and the built environment, findings on existing conditions in each town from both primary (field analysis) and secondary sources (public health data), a case study analysis of health elements, and the results of public outreach used to inform the plans for each community.

The Health Plans provide goals, policies, and implementation measures or recommended courses of action meant to affect change at the community level. The structure, content, rationale and layout are designed to serve as models for other communities across the County of San Luis Obispo, should similar endeavors be undertaken in the future. The documents will be provided to the projects' client, the Health Promotion Office of the County of San Luis Obispo Public Health Department, and will serve as a well-developed starting point and potential catalyst for a larger-scaled application for the county. These plans will also be presented to the County Health Commission, members of HEAL-SLO, and its Healthy Communities Workgroup, and local advisory bodies of each respective town.

Health Promotion Directive

One of the primary goals of both the San Luis Obispo County Public Health Department and the Health Commission is to enhance the quality of life for all people, specifically making efforts to identify and improve the social and root determinants of health in communities throughout the County. As public health advocates, they have

acknowledged the need to address the many chronic diseases and preventable health conditions which stem from unhealthy diets and sedentary lifestyles. They have recognized there is a multitude of contributing factors (social determinants of health) that can impact an individual's health status, including the built environment, access to healthy food sources and opportunities for physical activity and recreation, all of which are aspects of community design that fall under the purview of the planning profession.

Over the course of the past two decades, a reintegration of public health and city planning professions has occurred. Health departments have realized that without changes to particular physical determinants of health, behavioral changes cannot be influenced and risk factors contributing to chronic disease can neither be addressed or controlled (CCLHO & CHEAC, 2013). Being such, health departments have begun collaborating with planners in an effort to bring forth changes to community design and land use developments that impact the built environment and in turn, influence public health.

The built environment affects health through providing opportunities for physical activity, social interaction, and access to healthy food, and minimizing the risk for injury. Planning plays a role in all of these aspects of health, and communities seeking to improve the capacity for health can use the existing framework of the general plan. With these assertions, many jurisdictions in California have created Health Elements to include as optional elements into their existing general plans. The Cayucos and Oceano Community Health Plans will attempt to address health in planning as applicable at the small community level, while incorporating characteristics of a health element.

Relevance to Planning

City planning's origin can be traced to the late nineteenth century, birthed out of public health concerns that were byproducts of the rampant industrialization, urbanization and expansion of that era. Over the course of the next few decades, the two fields continued to work jointly to tackle the health issues of that day. However, by the first quarter of the twentieth century, the two fields began to diverge. "Public health took on a mainly biomedical focus on individual genetics, biology and behavior and how clinicians could affect those, and on a narrowly biological approach to epidemiology and evidence. Meanwhile the planning of built environments was hijacked by the car" (Lerner, 2010). By the middle of the last century, the two fields became their own specialized professions; each working independently of one another and with its own respective interests.

Today, a growing number of planning professionals and researchers are working to reintegrate public health and planning and contextualize land use decisions as a community health issue. Research has shown what has long been perceived as common sense: there is a strong correlation between the built environment and public health. "The designated use, layout, and design of a community's physical structures including its housing, businesses, transportation systems, and recreational resources affect patterns of living (behaviors) that, in turn, influence health" (Aboelata, 2004). The decisions we make regarding aspects of planning such as land use, vehicle circulation, zoning and street design are all elements that affect individual choices in diet and physical activity. The public health and community planning disciplines intersect in the interest of improving safety, nutrition, environmental quality, physical exercise, and the spread of disease.

Public health professionals are increasingly approaching health using a social determinant model that considers multiple factors impacting a person's life, including the natural environment, the built environment, living conditions, and the conditions of the community. This way of conducting research recognizes that approaches using the medical model, which emphasize diagnosis of an underlying disease or condition, have achieved limited effectiveness (Morris, 2006, p. 2). Collaboration with public health experts, integrating processes to address public health, and applying community design methods to ensure that the public has a say in the outcomes of planning documents are aspects crucial to the success of these planning efforts.

In addition to barriers to physical activity, planners are discussing food systems because of the way that inadequacies in the food system impact communities, especially in terms of public health. Planners influence the food system issue because food production, transport, and distribution are contingent on land use regulation. Agricultural specialization, technologies that improve shelf-life, and cheap transport has extended the distances that food travels, producing environmental impacts and equitable access concerns. The food system, good or bad, is impactful to the well-being of communities of all socioeconomic kinds, though the poor are generally more vulnerable to problems of food access (Corburn, 2009). Restrictive planning laws and practices have limited the location and construction of health-promoting built environments across metropolitan regions. In a study conducted throughout 1997 and 1998, 22 planning agencies were surveyed on the integration of food systems planning in their activities and comprehensive plans. Their conclusions showed that addressing these problems was usually done in a reactive way, rather than being comprehensive and forward-thinking (Pothukuchi and Kaufman, 2000b, pp. 115). Planners are in a unique position to

approach food access and distribution in a comprehensive, systematic, and interdisciplinary way (Hodgson, 2009).

Existing methods in planning have the potential to be of use for health-focused planning efforts. Many planning processes and actions do not consider public health issues outright because the decision making processes do not directly address them (Corburn, 2009, pp. 2). For example, the California Environmental Quality Act (CEQA) requires the analysis of impacts to people resulting from changes to the natural environment, but in practice this is usually limited to physical and chemical hazards. It does not include analysis of behaviors that result from the project impacts (Morris, 2006, p. 74). This means that some impacts to public health are not required to be considered through this process of analysis, and because of this, they are not mitigated through development requirements. Requiring adequate analysis of issues of public health and working concerns and issues into the process for creating public policy initiatives could help to ameliorate these shortcomings. On a project specific basis, Health Impact Assessments (HIA) are used as “a means of assessing the health impacts of policies, plans and projects in diverse economic sectors using quantitative, qualitative and participatory techniques” (World Health Organization [WHO], n.d.). These contain methods for establishing a health baseline, and assessing activities that will affect the baseline. Other methods are used to measure community health as well, and these methods may be integrated into long-term planning processes.

The reintegration of health into planning is being accomplished in California through the Health in All Policies (HiAP) initiative, climate action planning, and health elements in general plans. Each of these policy-affecting documents can help to address the environmental determinants of health, and require collaborative work between planners and public health workers. The goal of this project is to bring these concepts and

methods to the County of San Luis Obispo, starting at with a community-level health plan that functions as a health element.

Context of Study Areas

The County of San Luis Obispo includes seven incorporated cities, and 22 unincorporated census-designated places including Cayucos and Oceano. These unincorporated areas are governed by the County Board of Supervisors. As such, neither town has created a general plan which outlines self-guiding policies and detailed strategies for growth and development, but rather the towns are guided by the County General Plan.

Figure 1 – Context Map

Cayucos is a town of 2,592 people, located in the north coast region. The Second District boundaries extend from the Monterey County line in the north to Los Osos and

parts of San Luis Obispo, and it includes the unincorporated communities of San Simeon, Harmony, Los Osos, Cayucos, and Cambria. The Cayucos Citizens Advisory Council advises the District Two supervisor on matters related to planning and development. The community of Cayucos is part of the County Coastal Zone, and more specifically the Estero Planning Area.

As reported in the 2010 census, 87 percent of Cayucos residents identify themselves white, which is approximately 25 percent higher than the rate for San Luis Obispo County. The median age is 57.2 years old, well above the County's (37.4) and state's (45.6) figures. Cayucos' median household income is \$62,961.

Oceano is a town of 7,286 people, located in the southwest portion of the County. Along with the neighboring communities of Arroyo Grande, Grover Beach, Pismo Beach and Nipomo, it belongs to a larger regional metropolitan area known as the "Five Cities." The town is situated 16 miles south of the City of San Luis Obispo and 18 miles north of the City of Santa Maria in Santa Barbara County. Oceano is part of the South County Coastal Planning Area. Planning and development in Oceano is primarily governed by the Oceano Advisory Council and the Community Service District.

Oceano has a large population (47.8 percent) that identify themselves as Latino or Hispanic. With a median age of just 35.4 years old (45.6 state median age), as well as a median household income of \$41,865 (\$34,938 for Hispanic or Latino), Oceano can largely be considered a relatively young and low-income community.

Health Context

Recent statistical data has indicated nearly 42 percent of adults in California are not meeting the recommended guidelines of 150 minutes or more of aerobic physical activity

per week (Centers for Disease Control and Prevention, n.d.). Further, 35.3 percent of Californians were classified as overweight (BMI 25.0 – 29.9), while another 25 percent were classified as obese (BMI > 30.0) in 2012. These numbers are alarming indicators which place these individuals at high risk for many preventative diseases and health conditions which can lead to premature death.

The places we live and work; the distances we travel; the modes of transportation by which we take; the options we are provided for the foods we eat, as well as the places we relax and be physically active are all altered by the built environment, and ultimately affect the levels of health and wellness we can potentially achieve.

Table 1 Community Comparison Table

	Pop.	Median Household Income	Median Age	Poverty Levels	Education Attainment (≥ High School Diploma)	Residency Status (U.S. Citizen)
Oceano	7,286	\$41,865 (\$34,938 for Hispanic households)	35.4	16.50%	73.3% (14.7% < 9th grade)	23.20%
Cayucos	2,431	\$62,961	57.2	15.80%	94.50%	76.70%

Source: 2010 US Census Data.

While Cayucos and Oceano share many similar geographical similarities being coastal towns, the socio-economic profiles are vastly different for each community. The environments, circumstances and context in which these communities exist present different barriers and opportunities. For example, both areas are located in close proximity to the ocean, yet residents in Oceano don't have nearly the same ease of access to the beach, nor the facilities or amenities on it that Cayucos enjoys. The older age demographic in Cayucos presents a different safety concerns in terms of way-finding signage. The older age demographic in Cayucos presents a different safety

concerns in terms of injury prevention and access. While the relatively young median age (35.4 years old) in Oceano likely indicates a prevalence of young families and parents that would be receptive to issues that impact their children. The differences in education attainment levels and residency status may also give indication to potential comprehension issues due to a lack of familiarity with the project subject matter because of different cultural norms and values. These factors will be considered in outreach strategies and in the development of the Health Plans for each respective community.

Background Report

The Background Report informed the projects, helping to bring into context to the findings and information collected during the process of developing each Health Plan, and providing a basis for the goals, policies and action programs created for each respective community. The Background Report comprises several sections, including the Literature Review, Methodology, Existing Conditions and Findings for each community, and Next Steps.

The Literature Review establishes a knowledge base by examining the current academic literature, professional studies, reports, and best practices from the field. This section reviews the available research and reports on the correlation between health and the built environment, and relates these findings to the local communities. The section begins with an introduction and brief historical perspective on the relationship between city planning and public health. It then explores six separate topics that are relevant to healthy community building: physical activity, mental health, health equity, injury prevention, environmental health, and food access. Takeaway findings are provided at the end of each reviewed topic, relating the information back to specifically known issues within the communities, or raising awareness of certain factors.

The Methodology section describes the rational basis behind the chosen methodological approaches used to gather the required information needed to adequately inform the projects. The research methods were decided based on initial project questions (see Table 3 and 0) and identification of sources of information that would help answer those questions. The section is then divided into three phases: Phase I: Data Collection and Analysis; Phase II: Community Inventory and Outreach; and Phase III: Goals, Policies, and Action Programs. Each of these phases have corresponding subsections which provide various informational aspects that build a well-informed understanding of the current context, circumstances and issues each community is facing, which are the basis for the strategies outlined at the end of each community's Health Plan.

The Existing Conditions section provided quantitative information from various sources for Cayucos and Oceano's current demographic makeup, socioeconomic conditions and infrastructure, as well as other conditions of interest related to the project. This section describes the health conditions in Cayucos and Oceano through data and findings outlined in the 2013 ACTION for Healthy Communities Report, released in 2014 by the Community Foundation, public school survey results, public health data, and information from applicable existing plans. This section provides a basis for conducting further research.

The Findings sections describe the multifaceted studies conducted in Cayucos and Oceano to better understand the characteristics of the community, both in terms of the built environment and local knowledge. A physical inventory was conducted to achieve an understanding of the existing built environment in Cayucos, and ample community outreach provided local knowledge to augment this research. The Key Findings section combines the most important, relevant, and frequently-encountered findings to present a summary that is useful for the creation of the draft plans.

The Next Steps section briefly describes steps that could follow completion of the Background Report and the plans, focusing on implementation of ideas.

The appendices include charts and materials that provided information for the background report and the plans, and which are included for reference. The appendices also include the two community health plans.

The Community Health Plans

The Community Health Plans for Cayucos and Oceano are structured similarly for formatting consistency, but feature variances in content in some instances, as well as certain goals and related strategies that were developed uniquely to address the identified needs and community-voiced concerns of each town. Each Health Plan contains an introduction explaining the health promotion directive and purpose of the projects; a summary of goals tailored to that community; historical background on the relationship between health and the built environment; a review of how public health has been previously addressed in existing (local and regional) planning policy documents; a summary of outreach efforts conducted in each town; a health and wellness context section that describes city planning and public health concepts related to the built environment and corresponding relevance to each town; and finally, a series of goals, policies and action programs that will help guide Cayucos and Oceano on paths to becoming healthier communities. The Health Plans are attached to the Background Report as separate appendices.

LITERATURE REVIEW

LITERATURE REVIEW

Introduction

A literature review was conducted in an effort to build a thorough knowledge base of contemporary research and understanding on the relationship between the built environment and public health. Current academic literature, news articles, professional guides, reports, best practices and historical perspectives from the fields of planning and public health were surveyed. The literature review was broken down into six separate subsections that are foundational to understanding and developing a planning document meant to provide guidance in establishing healthier communities: physical activity, mental health, healthy equity, injury prevention, environmental health, and food access. A description of selected findings and its corresponding implications for the project will be discussed at the end of each of subsection. To provide added context regarding the general subject, a historical overview of the relationship between city planning and public health has been provided first.

Historical Perspective

The bond between city planning and public health can trace its roots to nearly 150 years ago. “The emergence of urban planning as a profession and academic discipline had its basis in nineteenth century public health initiatives, including tenement housing reforms, the construction of urban water supply and sewerage systems, and the design of parks and playgrounds” (Corburn, 2007, p. 688). Due to the burgeoning industrialization and urbanization of that time, major American cities of that day were the antithesis of sanitary and healthy, overrun with human and animal waste, trash and general squalor, major cities were a breeding ground for infectious diseases such as yellow fever, cholera, typhoid and tuberculosis. Further, toxic air pollution and run-off from nearby industrial

sites, ventilation and lack of clean water sources made living in a city a health risk. “By the end of the nineteenth century, modern American urban planning emerged as a field that used physical interventions to respond to urban public health crisis” (Corburn, 2006, p. 27).

The effort to improve sanitation in U.S. cities was led by Frederick Law Olmstead, the designer of Central Park in New York City and the head of the US Sanitary Commission during the civil war. He believed that the way to improve public health was to abandon the “old-fashioned compact way of building towns and the gradual adoption of a custom of laying them out with much larger spaces open to the sun-light and fresh air.” This vision persisted throughout the 20th century, and contributed to the idea that the low-density city was ideal for addressing matters of public health (Frank, 2003, pp. 14-16). In this way, public health concerns were a major part of public planning from the birth of the profession.

The first quarter of twentieth century saw many of the basic primitive health issues resolved. Advancements in research and technology led to the understanding of diseases being biological in nature instead of environmental (Drummond, 2013). The two disciplines began to drift into their own separate fields of practice. Public health became the domain of science and medicine focused on controlling and identifying the causes of infectious diseases. City planning became primarily concerned with urban form, land use, growth and zoning.

Improvements in public health corresponded with scientific and technological advancements. Attempting to resolve health issues on a broad scale by physical removal and separation from perceived harmful agents through the built environment was no longer favored. Rather, the advent of *germ theory*, the belief that

microorganisms caused infectious diseases, was thought to be the answer to most health problems. As a result, “public health shifted toward specific interventions, such as immunizations and the chlorination of drinking water, to kill disease-carrying microbes” (Corburn, 2007, p. 692). This new scientific understanding proved groundbreaking in how we dealt with diseases such as cholera, typhoid, diphtheria and tuberculosis, and it gave health professionals such as chemists, physicians and biologists, serious clout with the public.

The same period of the twentieth century gave rise to professional city planning and what could be termed as the era of “the City Scientific” (Corburn, 2006, p. 29). Planning was seen as a rationally based technical craft that could bring comprehensive improvement to urban areas via the built environment, whereas planning done in the last half of the nineteenth century was viewed more as reactionary, fragmented in application and arising out of necessity, rather than prescriptive in practice. Early urban planning and design pioneers such as Daniel Burnham, Edward Bennett, Ebenezer Howard (Garden Cities) and Frederick Law Olmstead, helped champion the move to creating beautified, grandiose and orderly cities with the hope that it would promote civility and morality among the citizenry. However, focus on the aesthetic aspects of the city left concerns for public health issues by the wayside. This did not go unnoticed. Benjamin Marsh, then leader of the Committee on the Congestion of Population stated “the planning profession ought to be judged on whether interventions improve the health of the least-well-off city dwellers, not on designing aesthetically pleasing and efficient cities” (Corburn, 2006, p. 28). Marsh stated poignantly in his 1909 book, *An Introduction to City Planning: Democracy’s Challenge to the American City*, “no city is more healthy than the highest death rate in any ward or block and [...] no city is more beautiful than its most unsightly tenement. The back yard of a city and not its front lawn is the real criterion for

its standards and its efficiency” (Corburn, 2007, p. 694). Nevertheless, despite pushback from some, rationality, science and technical expertise became the driving ideology moving forward.

MID-TWENTIETH CENTURY

The reliance on science had created an ideological shift of focus in the field of public health and the two historically linked disciplines became disconnected; public health research shifted its focus into finding immunizations and disease interventions for the public; with a few exceptions, planning began to concern itself primarily with zoning codes, promoting suburban development, transportation infrastructure and efficiency (Coburn, 2004, p. 542).

By the mid-twentieth century, the economic expansion and prosperity our country experienced after World War II led to rapid home building and community development. Much of the construction during this period was predicated on the federal government investing into the transportation infrastructure of the country. In 1956, President Eisenhower signed into law the Federal Aid Highway Act, which authorized the construction of more than 40,000 miles of Interstate Highway System roadways. This made traveling wildly popular and car ownership became widespread. This allowed people to move out of the city and into remote surrounding areas that were now easily accessible by highway. As new single-family residential neighborhoods cropped up, so did the call for city planners to allocate land use for needed commercial and retail services as communities became sprawled out. Soon, the provision of sidewalks, bike lanes and pedestrian friendly infrastructure became secondary, as planning began to place an emphasis on designs meant to accommodate the automobile such as wider streets and creation of arterial roads for increased traffic flow and capacity.

Such an infrastructure deterred physical activity and the use of pollution-reducing alternate forms of transportation. The end result was widespread traffic congestion; increased commuting time; increased vehicle, pedestrian and biking crashes and injuries; a growing obesity epidemic; a rise in air pollution and respiratory illness; and a growing sense of disconnection between workplaces and homes. (Centers for Disease Control and Prevention, 2009, p.9).

LATE TWENTIETH CENTURY

Throughout the past 30 years, there has been a reconnection between the planning and public health fields. The infectious disease epidemics of the late nineteenth and early twentieth century are primarily gone in the United States (Table 2). Today, the battles are with chronic and preventable diseases—contemporary health issues that are equally dynamic, interconnected and complex (Northridge & Freeman, 2011, p. 593).

Table 2 Leading Causes of Death in the U.S., 1900, 1950, and 2000

Ranking	1900	1950	2000
1	Pneumonia and influenza	Diseases of the heart	Diseases of the heart
2	Tuberculosis	Malignant neoplasms	Malignant neoplasms
3	Diarrhea, enteritis, and ulceration of the intestines	Vascular lesions affecting central nervous system	Cerebrovascular diseases
4	Diseases of the heart	Accidents (unintentional injuries)	Chronic lower respiratory diseases
5	Intracranial lesions of vascular origin	Certain diseases of early infancy	Accidents (unintentional injuries)
6	Nephritis, all forms	Influenza and pneumonia, except pneumonia of newborn	Diabetes mellitus
7	All accidents (unintentional injuries)	Tuberculosis, all forms	Influenza and pneumonia
8	Cancer and other malignant tumors	General arteriosclerosis	Alzheimer's disease
9	Senility	Chronic and unspecified nephritis and other renal sclerosis	Nephritis, nephrotic syndrome, and nephrosis
10	Diphtheria	Diabetes mellitus	Septicemia

(Dannenberg et al., 2011, p. 13)

Starting in the early 1980s, the Healthy Cities movement began espousing the notion of chronic disease prevention, participatory government, sustainability, health equity and acknowledgment that built environment factors may influence public health (Dannenberg et al., 2011, p. 26). The movement gained traction globally, with the establishment of a program at the European office of the WHO.

In the United States, many of the aforementioned urban health principals established by Healthy Cities have begun being commonly incorporated into planning strategies, such as mixed land use, street connectivity, residential density and active transportation infrastructure across the country.

In California, the reintegration of health into planning is being accomplished through the Health in All Policies (HiAP) initiative, climate action planning, and health elements in general plans. Each of these policy-affecting documents can help to address the environmental determinants of health, and require collaborative work between planners and public health workers.

Physical Activity

The relationship between physical activity and corresponding positive health benefits has been well-researched and strongly correlated. The WHO defines physical activity as “any bodily movement produced by skeletal muscles that requires energy expenditure” (WHO, n.d.). It has been estimated approximately 400,000 premature deaths occur annually in the United States as a result of the negative health outcomes which stem from obesity due to physical inactivity (Mokdad, Marks, Stroup, & Gerberding, 2004).

According to the Centers for Disease Controls and Prevention (CDC) website, chronic diseases are the leading causes of death and disability in the United States (2014). In

California, it's the leading cause of premature morbidity and mortality. A foundational U.S. Surgeon General's Report on Physical Activity and Health (1996), concluded people of all ages who are generally inactive can improve their health and well-being by becoming even moderately active on a regular basis. In addition:

- Reduces the risk for dying prematurely
- Reduces the risk for dying from heart disease
- Reduces the risk for developing diabetes
- Reduces the risk for developing high blood pressure
- Helps reduce blood pressure in people who already have high blood pressure
- Reduces the risk for developing colon cancer
- Reduces feelings of depression and anxiety
- Helps control weight
- Helps build and maintain healthy bones, muscles, and joints
- Helps older adults become stronger and better able to move about without falling
- Promotes psychological well-being

(U.S. Surgeon General's Report on Physical Activity and Health, 1996)

In 2008, the Physical Activity Guidelines Advisory Committee, a group of 13 leading experts in the field of exercise science and public health, released a report which was a comprehensive review of the published scientific literature relating health to physical activity that had been produced since the 1996 Surgeon General's Report on Physical

Activity and Health (Physical Activity Guidelines for Americans, 2008). The committee's research of the data summarized the following major findings:

Figure 2 – The Health Benefits of Physical Activity

The Health Benefits of Physical Activity—Major Research Findings

- Regular physical activity reduces the risk of many adverse health outcomes.
- Some physical activity is better than none.
- For most health outcomes, additional benefits occur as the amount of physical activity increases through higher intensity, greater frequency, and/or longer duration.
- Most health benefits occur with at least 150 minutes a week of moderate-intensity physical activity, such as brisk walking. Additional benefits occur with more physical activity.
- Both aerobic (endurance) and muscle-strengthening (resistance) physical activity are beneficial.
- Health benefits occur for children and adolescents, young and middle-aged adults, older adults, and those in every studied racial and ethnic group.
- The health benefits of physical activity occur for people with disabilities.
- The benefits of physical activity far outweigh the possibility of adverse outcomes.

(Physical Activity Guidelines for Americans, 2008)

Growing research has linked chronic diseases to specific risk factors—such as obesity, smoking, poor nutrition and physical activity—which are strongly influenced by economic and education levels, social norms, and the built environment. Specifically, the role of the built environment, which is “defined broadly to include land use patterns, the transportation system, and design features that together provide opportunities for travel and physical activity” (Transportation Research Board [TBR] & Institute of Medicine [IM],

2005, p. xiii) has been identified by practitioners in both the urban planning and public health fields as major factor in affecting active living behavior.

Numerous research studies over the past two decades have established a strong foundation of corollary evidence that supports the notion that the built environment impacts physical activity behaviors (TBR & IM, 2005; Saelens & Handy, 2008; Feng, Glass, Curriero, Stewart, & Schwartz, 2010), though no single determinative aspect has been identified. Research by Humpel, Owen, and Leslie (2002) has indicated accessibility and proximity to destinations are strongly associated with increased walking behavior. Suburban neighborhood site designs were found to inhibit active behavior due to an emphasis on automobile road networks, creating inefficient walking routes due to inordinately large block sizes and incomplete sidewalk systems (Hess, Moudon, Snyder, & Stanilov, 1999). Evidence collected Saelens, Sallis, and Frank (2003), suggests individuals living in communities with higher density, connectivity and mix of land use reported higher rates of pedestrian/cycling for utilitarian purposes versus those from less dense, poorly networked, single land use neighborhoods. Other research has found multi-level social ecological factors such as urban aesthetic, perceived safety, accessibility and opportunity for social interaction to be motivating factors for increased physical activity (Lee&Moudon, 2004; Brownson, Baker, Housemann, Brennan & Bacak, 2001). Finally, research findings are not reliably predictable across the board; low socioeconomic status (SES), black and Hispanic minority groups are influenced greatly by access to food stores, exercise facilities and safety versus traditional catalysts such as walkable or compact environments (Lovasi, Hutson, Guerra, & Neckerman, 2009).

Sallis, Millstein and Carlson (2011), in the seminal compendium *Making Healthy Places* provide a summary of key points compiled from research related to relationship between urban design and physical activity (p. 33):

- Some built environment attributes are associated with higher levels of physical activity
- Access to recreation facilities, quality and safety of pedestrian facilities, and aesthetics are poorer in areas with mostly low-income and racial or ethnic minority populations
- Adding or improving recreation facilities may not be enough to lead to their increased use. Activity programs and marketing may also be needed
- Comprehensive interventions that include environmental changes, education, and other components have increased active transport to schools and overall use of bicycles in cities
- Living close to parks, trails, and recreation facilities is related to greater use of facilities and more recreational physical activity

(An abbreviated list taken from Sallis et al., 2011, p. 33)

SELECTED FINDINGS AND PROJECT IMPLICATIONS

- There is no single determinant which will provoke physical activity, but rather a complex mix of ecological factors (Saelens & Handy, 2008). While land use and aspects of the built environment may play a significant role in health outcomes, planning professionals must be cognizant of the many social ecological aspects that may elicit or inhibit active lifestyles. This is an important consideration when developing community health recommendations for the project. Educational, cultural or other socio-ecological determinants to physical activity should be identified and factored into strategies meant to help resolve health issues in Oceano.

- Low-SES, disadvantaged minority individuals respond to certain built environment characteristics differently than other groups. Research has shown African American and Latino populations that can be classified into these groups are influenced greatly by food stores, exercise facilities and safety versus walkable or compact environments (Lovasi et al, 2009). This is both an important and relevant finding when considering Oceano's current socioeconomic demographic profile. A quality food access inventory should be conducted in order to identify the quantity of food vendors and quality of food sources within Oceano community. Likewise, an inventory of park and recreation facilities should be conducted to properly determine the availability and accessibility of these amenities for the local population. Inquiries regarding residents' perception of neighborhood and community safety should be solicited on surveys and key informant interviews in order to gain clearer insight into inhibitors to physical activity.

Mental Health

According to the American Institute of Stress (2011), an increasing number of Americans are citing personal health and their family's health as a source of stress. Godbey (2009) states an "estimated 75 percent of all visits to primary care physicians are for stress-related complaints and disorders" (p. 3). Humans have spent thousands of years adapting to the natural environment, but only recently (relatively speaking) in the past few centuries have humans disengaged themselves from nature in favor of the man-made structures found in our urban environments (Maller, Townsend, Pryor, Brown, & St. Leger, 2005). In the United States, as our population has continued to increase, so has the urbanization of our residential areas, making public parks important assets in

keeping us connected with nature. In their book *Designing Healthy Communities*, authors Richard J. Jackson and Stacy Sinclair describe the following polemically:

If we set out to create a depression-inducing environment, the key features would include prevention of exercise, removal of interesting and pleasing natural features, excess noise, chaotically designed and located structures, and the creation of social isolation and anxiety—precisely what we have built in the mid- to late twentieth century. (2012, p. 11)

In *Making Healthy Places*, Sullivan and Chang (2011) provide the following key points regarding mental health and the built environment (p. 106):

- Places that encourage physical activity can both prevent and treat depression
- The built environment can promote or hinder mental health
- The conditions of modern life place great demands on—and often—exhaust our ability to pay attention. Green settings have the capacity to alleviate mental fatigue and help restore a person’s capacity to pay attention

(An abbreviated list taken from Sullivan & Chang, 2011, p. 106)

Research studies have indicated being in contact, or in the very least, in sight of natural environments has beneficial effects on our mental health (Maller, Townsend, St Leger, Henderson-Wilson, Pryor, Prosser, & Moore, 2009). Further, Maller et al. (2005) argue that “Empirical, theoretical and anecdotal evidence demonstrates contact with nature positively impacts blood pressure, cholesterol, outlook on life and stress-reduction” (p. 49). The provision of open spaces, green spaces and parks, i.e., the built environment, contribute to overall well-being through increased levels of physical activity, relaxation,

recreation and social engagement (Maller et al., 2009, p. 54) and is beneficial across all age groups (Mass, Verheij, Spreeuwenberg, & de Vries, 2006, p. 590).

For low-SES communities where residents lack the disposable income to purchase private gym memberships or pay for stress reducing entertainment or activities, parks can serve as a cost-effective means of relieving stress and improving overall well-being. Though, disadvantaged communities which are typically found in over-paved, underdeveloped or industrialized urban areas are especially vulnerable to a lack of public amenities and well-maintained open spaces, parks and recreations areas (Sherer, P. M., 2006, p. 8).

SELECTED FINDINGS AND PROJECT IMPLICATIONS

- Research findings from Mass et al. (2006) indicate positive health perceptions are directly relational to proximity to green space (p. 591); further, “The relation seen between green space and health was stronger for the less educated group and this is exactly the subgroup that is less likely to have much choice in their neighborhood of residence” (p. 592). Inquire into Oceano’s education attainment levels is necessary to account for any added vulnerability due to lack of provision green space, parks or recreation areas. Recommendations developed for the health plan should place an emphasis on adding park and green space amenities within the community. A potentially more feasible alternative could involve the development of a shared use agreement with Oceano Elementary school. This strategy would provide residents permission to use the school grounds after-hours, and could be promoted at school and within the community.

- As it is in Oceano, impoverished communities by definition lack adequate provision of public amenities such as parks and open spaces due to lack of economic resources, with poorly designed land uses and dilapidated buildings, roads, and active transportation infrastructure (if any). These byproducts of economic hardship require creative strategies can benefit a community with Oceano's SES profile. Research is required to identify comparable communities that have successfully incorporated healthy community policy strategies that are both feasible in scope and in implementation for a town like Oceano.

Health Equity

Healthy People 2020 defines health equity as “the attainment of the highest level of health for all people. Achieving health equity requires valuing everyone equally with focused and ongoing societal efforts to address avoidable inequalities, historical and contemporary injustices, and the elimination of health and health care disparities” (Disparities, n.d.).

The roots of both city planning and public health are intertwined, and can be traced back to mutual concerns over widespread health inequities that were prevalent in poor urban living environments of the mid to late nineteenth century in America. During the early to mid-part of the twentieth century, as these two fields diverged into their own respective specialized practices, city planning practices started yielding its own, often insidious, health implications that were largely ignored or discounted at the time. Planners played a major role in determining density, access to parks, highways and stores. Zoning practices were enacted to concentrate certain minority groups into residentially segregated neighborhoods. Land use decisions allowed for residential areas to be located next to toxic industrial areas and waste sites in neglected parts of town.

Health inequalities (or disparities) persist today within populations and by some measures the equality gap is widening despite more than a century of concerted public health interventions (Northridge & Freeman, 2011, p. 582).

Not all communities have equal access to physical activity resources or environments that support an active lifestyle. Low-income communities and communities of color have been found to have limited facilities and spaces for physical activity, poor sidewalk and street infrastructure, and disproportionate exposure to violence. These hindrances may deter or limit opportunities for those populations to engage in physical activity. Additionally, the physical activity infrastructure that does exist in many communities, low-income or not, may not be developed with all potential users in mind. As a result, populations with special needs such as the elderly and people with disabilities may not be properly accommodated. (CDC, 2013)

Gordon-Larsen, Nelson, Page, and Popkin (2006) argue that minority and groups of low educational attainment are at the highest risks for obesity and many chronic and preventable diseases (p. 418), and support from their research results indicate high-SES groups have better odds of having access to recreation facilities, while low-SES and high-minority groups have reduced access to the similar facilities, which in turn is associated with reduced rates of physical activity and increased levels of obesity (p. 420).

In addition to inequalities found in the built environment that can affect physical activity levels, low-SES and disadvantaged minority communities face additional difficulties in accessing healthy and nutritious food sources. Research by Moore and Diez Roux

(2006) indicates low-income and non-White areas had fewer fresh produce markets, specialty and natural food stores, while liquor stores were much more likely to be found in poor areas versus wealthier ones (p. 329). Further research has shown an association between race and economic status with availability of chain supermarkets—low-income neighborhoods had fewer chain supermarkets than middle-income neighborhoods—the availability of chain supermarkets in African American neighborhoods was approximately only half (52 percent) that of White neighborhoods—and even less available in Hispanic neighborhoods (32 percent) (Powell, Slater, Mirtcheva, Bao, & Chaloupka, 2007, p. 190).

SELECTED FINDINGS AND PROJECT IMPLICATIONS

- Oceano profiles as a low education attaining, low-SES, and disadvantaged minority population. As such, the population is especially sensitive to inequalities found in the built environment and at higher risk for obesity and many chronic and preventable diseases. This can include lack of access to park and green spaces; lack of access to healthy food resources; poor quality infrastructure; and proximity to environmentally hazardous areas. The implications to the project were to ensure health equity encompasses all aspects of planning and public health, factoring it into every strategy, recommendation and policy outlined in the health plan.
- Planners have an influence on the type of food outlets permitted, the location and density of food outlets, as well as controlling access and active transportation options to these food sources. The implication on the project were to develop creative strategies and policies that would help narrow the health inequality gap; increasing access to food outlets by improving active transportation infrastructure and connectivity; providing incentives to attract healthy food retailers and streamlining the permit/application process for these

types of businesses; ensuring transit routes have stops at large chain supermarkets.

Injury Prevention

In 2008, the Physical Activity Guidelines Advisory Committee reported findings from amalgamated scientific literature on the health benefits of exercise, including that the benefits of activity far outweigh the possibility of adverse outcomes. However, physical activity can expose individuals to risks for injury, due in part to the high priority of accommodation of vehicles and the incomplete adoption of designs and practices for injury prevention in our environments. Injuries are not accidents. The frequency and situations in which they occur can be influenced, controlled, and changed. Planners seldom specifically address injury prevention, though traffic safety measures, building codes, and development standards all exist for user safety—whether explicitly or implicitly. Injuries may be more or less likely dependent on environmental features such as lighting, hazard identification (signs), hazard management (i.e. fencing), and the general design of the built environment. The challenge in thinking about public space is to create environments that help people participate in increased levels of physical activity *safely*.

Due to several factors, the health of children, elderly populations, and low-income area residents are especially affected by injury occurrences. Some of these factors are attributable to user characteristics such as balance, vision, coordination, or cognitive ability and some may be due to lack of maintenance of areas or inequity issues (NZIPS, 2014).

Pedestrian areas and areas where there are no intersections in particular are important to consider for injury prevention. Falls are the leading cause of injuries reported to

emergency rooms. Uneven surfaces are a major cause, along with slippery surfaces, steepness, and stairs that are hard to see or too high. Obstructions such as pavement signs, poorly sited street furniture, protruding grates or manhole covers, and litter and other debris, create tripping hazards. Seniors are more susceptible to falls, and a large number of injuries are attributable to falls while using footpaths or sidewalks. Injuries occur on streets due to vehicle speeds and increasing numbers of vehicles

Injuries occur on streets due to vehicle speeds and increasing numbers of vehicles. Pedestrian deaths are higher in the US than Europe, and affect the men over age 85 and women between the ages of 75 and 84 disproportionately—two times more while walking than people between 15 and 24 years of age (CDC, 2013). Minority populations are at the greatest risk, and men of all demographics were two-and-a-half times more likely than women to be killed by a car while walking (CDC, 2010). In 2010, 79 percent of pedestrian fatalities occurred at non-intersections.

The Department of Transportation has studied numerous tactics to reduce injury-by-vehicle and promote health, which they call safety countermeasures. These include features that call a driver's attention to a pedestrian area, naturally cause slower speeds, and increases in physical space for pedestrians and bicyclists. The new list of proven safety countermeasures includes:

- Safety Edge
- Roundabouts
- Longitudinal Rumble Strips and Stripes on 2-Lane Roads
- Enhanced Delineation and Friction for Horizontal Curves
- Medians and Pedestrian Crossing Islands in Urban and Suburban Areas

- Pedestrian Hybrid Beacon
- "Road Diets" (Roadway Reconfiguration) (Furst, 2012)

These measures can increase actual and perceived safety and encourage active use of the built environment.

SELECTED FINDINGS AND PROJECT IMPLICATIONS

- Injuries occur due to vehicle speeds and the increasing numbers of vehicles, so it is important that future neighborhood designs and improvements to existing areas slow traffic, alert drivers of pedestrian presence, and restrict the numbers of vehicles where appropriate.
- Children and the elderly are especially susceptible to injury, and improvements to footpaths, sidewalks, and stairs will be important to consider in conducting the project.
- Though injury prevention presents its own set of challenges, a built environment that is designed to prevent injury will also serve to encourage active use, helping people participate in increased levels of physical activity.
- There are proven measures for addressing the occurrence of injuries, and these should be incorporated into planning documents where appropriate.

Environmental Health

Humans are affected by the environmental quality in the places they live, work, and visit. Although the overall health of the environment contributes or detracts from health in a number of ways, inadequate water and air quality directly affect humans.

Acute and long term air pollution due to ground level ozone and particulate matter has been shown to have negative impacts on health. Ground level ozone is the main component of smog, and is caused by the emissions of industrial facilities and electric utilities, motor vehicle exhaust, gasoline vapors, and chemical solvents (EPA, 2012). Long term pollution has been associated with increased mortality and morbidity and specifically with cardiorespiratory mortality (Bell, 2010). Acute exposure to "Particulate matter," also known as particle pollution or PM air pollution is associated with an increase in hospital admissions for ischemic heart failure, myocardial infarction, asthma and chronic obstructive pulmonary disease (Halonen, 2010; Peters, 2001). According to the EPA, the size of particles is directly linked to their potential for causing health problems. Particles 10 micrometers in diameter or smaller generally pass through the throat and nose and enter the lungs and can cause serious health effects including premature death in people with heart or lung disease, nonfatal heart attacks, irregular heartbeat, aggravated asthma, decreased lung function, and increased respiratory symptoms, such as irritation of the airways, coughing or difficulty breathing (EPA, 2012). The effects of air pollution, most of which is attributable to human activities, are directly related to human illness and health problems.

There are several personal choices that communities can make that reduce air pollution, including conserving energy, recycling, planting trees, using public transportation, carpooling, or riding a bike for some trips (EPA, 2014). The San Luis Obispo Air Pollution Control District works from a strategic action plan to meet air quality thresholds and reduce pollution rates for point-source and non-point source pollution, although the agency has encountered challenges due to limited authority to regulate and public resistance to change (APCD, 2012). Best practices for reducing air pollution locally are difficult, since air does not conform to city or county limits, but successful efforts have

included social marketing campaigns to affect individual behaviors, enforcing compliance with the Clean Air Act, phasing out polluting sources of energy, and investing in public transit (NYC Global Partners, 2011).

Storm water runoff, the water that flows to the storm drains during and after a rain event contributes to microbial contamination of water supply. Streams and rivers downstream from developed areas have higher bacterial counts after rainfall (Gannon, 1989). Urban runoff is responsible for a huge amount of the water pollution. As an example, approximately 47% of the pathogen contamination of the Long Island Sound is attributable to runoff (EPA, 1994). Much of the contamination is from non-point source pollution, with major sources including runoff from farms, parking lots, streets, and golf courses. Contaminants include pesticides, metals, nitrates, pharmaceuticals, and organic chemicals.

There is a strong relationship between large rainfalls and outbreaks of waterborne diseases. More than half of the documented waterborne disease outbreaks since 1948 have followed extreme rainfalls (Curriero, 2001). The extent of water-related illnesses can be from microbial or chemical contamination. Of the 99 million cases of acute gastrointestinal illnesses with vomiting or diarrhea, 6% - 40% may be related to drinking water (Payment, 1991). Public water infrastructure may not be adequate to handle increased development; increased development competes for infrastructure dollars. Twenty-six percent of the piping in the US is judged to be - at best - in 'fair' condition (Clark, 1999). Pipe leaks and breaks can be a source of water contamination (Levin, 2002). Water resources are also necessary for the success of agriculture and the health of fisheries, which in turns affects food security. The food system is implicated in the quality of local water, air, and soil, and thereby more widely affects the quality of life than is reflected in efforts to be deliberate about the food system (Pothukuchi and Kaufman,

1999, pg. 214). Waterborne illnesses can be caused not only by drinking contaminated water, but also by eating produce irrigated with untreated water, eating seafood caught in contaminated water, and swimming or other recreation in polluted water (Craun, 1992).

Similarly to air quality control, water pollution from runoff and stormwater is difficult to control at a non-point source level. As authorized by the Clean Water Act, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. The EPA lists and describes a number of best practices for stormwater management, many of which improve the water quality of runoff as well prior to deposit into streams and the ocean. These include bioretention cells or rain garden, eliminating curbs and gutters to increase sheet flow and reduce runoff volumes, grassy swales that help to slow runoff and facilitate infiltration, separation units to remove pollutants, permeable pavement, rain barrels and cisterns that harvest rainwater for reuse, tree box filters, vegetated filter strips, and green roofs (EPA, 2012).

SELECTED FINDINGS AND PROJECT IMPLICATIONS

- Low air quality in the communities of Cayucos and Oceano may be causing disease and worsening individuals' existing health problems.
- Contaminated water may negatively affect communities that engage in seemingly healthy behaviors such as drinking water, eating seafood, and swimming or surfing. These behaviors should be encouraged by ensuring that the natural environment is as clean and pollution-free as possible.
- Storm water runoff contributes to microbial contamination downstream from developed areas, such as communities near the coast. Though this is a problem

that originates regionally, it is important to consider the effects for the local communities and make steps to reduce contaminated runoff.

- Runoff from area farms, parking lots, streets, golf courses, and lawns may be causing problems in coastal communities such as Oceano and Cayucos. Steps should be determined to reduce non-point source pollution.
- There is a strong relationship between large rainfalls and outbreaks of waterborne diseases. Increasing awareness about this relationship, in addition to taking steps to reduce disease-causing pollutants, are important to consider when creating a plan to improve community health.

Food Access

Inadequacies in the food system impact communities, especially in terms of public health. In response to the environmental costs of the food system, the popularity of local food is on the rise. “Local” farmers are not inherently better stewards of the environment, though having a smaller area of land to care for or fewer animals increases the this likelihood (Hinrichs, 2003, p. 35). Local food production and sales contributes to higher degrees of social capital and care, resulting from the possibility of face-to-face interaction, mutual knowledge, and the idea that “your farmer” is part of the community (Hinrichs, 2003, p. 36). The proliferation of the term “food miles” to measure the impact of the food system on the environment reinforces the logic of local production. Important too is the energy cost of packaging and preparing food, which is higher than the costs of fresh food that is grown at long distances (Hodgson, 2009). Many foods do not travel a single route, but take many steps along the supply chain from “Field to plate” (Food distribution, 2010, p. 3).

The concentration on local food is important, but it is more significant to concentrate on the impacts of the system as a whole. Fresh, minimally processed, local food is generally the most nutritionally valuable and the least detrimental to the environment. Access to affordable grocery stores and farmers markets increases the likelihood that people will eat healthy food, while those surrounded by convenience and liquor stores are less likely to eat healthy food (Corburn, 2009, p. 80). However, the most accessible foods in most areas are high in calories but low in nutritional value (Hodgson, 2009). The food system is impactful to the well-being of communities of all socioeconomic kinds, though the poor are generally more vulnerable to problems of food access (Corburn, 2009). Planners are inherently part of the food system because food production, transport, and distribution are contingent on land use regulation. The lack of analysis of food systems may lead, to use a wide-spread example, to including grocery stores into broader commercial development categories, therefore failing to acknowledge it as a high-priority need for households, and restricting food access.

Pothukuchi and Kaufman (2000a) offer several ways that planners could help to improve the food system. These include collecting data about the food systems; analyzing this data to come up with concrete terms for issues and to better plan for improvement; assessing the ways that current plans impede the progress of food systems, through such ways as allowing community gardens to be paved and developed; and restricting location of grocery stores or food outlets, or closing food pantries and soup kitchens all negatively impact access to food. Planners could work to remove these and other kinds of barriers and instead create policies that encourage and increase access to food. Additionally, and in relation to these efforts, planners could work to explicitly integrate food security goals into community plans. Specific goals may help to foster relationships between public, private, and non-profit agencies, and between private enterprise and the

public. Though planners already have many tools available to plan for better food systems, this undertaking will also require cooperation with their communities and public health experts.

SELECTED FINDINGS AND PROJECT IMPLICATIONS

- Inadequacies in the food system impact community health, but food production, transport, and distribution are contingent on land use regulation.
- The environmental impacts of the current food system affect all communities, but addressing these impacts must take place on a regional level.
- The equitable access concerns of our current food system may be limiting the potential for healthy eating in Oceano and Cayucos.
- Problems of food access may be affecting both Oceano and Cayucos, due to location and socio-economic status.
- Unlike most planning documents that integrate food systems planning into their plans in a reactive way, a plan centered on health should strive to include healthy eating priorities in a comprehensive and forward-thinking way.

Healthy Planning Best Practices

There are several examples of literature and professional documents that discuss planning for healthy communities. Of these, some discuss general plan elements specifically, while others focus on certain aspects of creating programs or policies that allow a greater degree of healthfulness, such as funding for access to local food, achieving a higher degree of active transportation, or identifying and working towards solving equity issues. These guides provide research and practical advice for plan goals,

policies, programs, and implementation measures, as well as how to go about conducting community outreach and constructing a healthy plan.

One crucial aspect for health elements or healthy plans is to focus on partnering and collaboration. Daniel Stokols writes about combining two strands of health promotion strategies to achieve a greater outcome. In illustrating an example, he writes, “If a community goal is to reduce levels of obesity in the population, then a multi-component program that incorporates health education strategies and the creation of new fitness facilities and outdoor recreational space is likely to be more effective in achieving that goal than a single-component intervention that focuses on either human or material resources for health promotion but not both” (Stokols, 2012, p. 9). This highlights the value of maximizing the leveragability or joint influence among multiple program components on key health behaviors and outcomes. Other resources suggest identifying champions of health and leaders in the community, such as recreation programs or members of the healthcare community. Another tip for outreach is to engage stakeholders “where they are,” by, for instance, going to standing meetings or events. Another commonly mentioned tip was to work across sectors, especially within government departments or bodies.

As part of outreach, it is recommended that education be utilized. Specifically, this includes the use of an “environmental frame” to demonstrate how places influence health. Because health is thought of as a highly personal matter that is attributable to genetic factors and individual choices, focusing on “root determinants” is crucial to the education component. Another tip is to come to agreement on terms and priorities between public health and planning to eliminate confusion when working with the public. Because public health and planning traditionally focus on very different subjects, it is

important that there is a strong level of understanding of the overlapping issues, and that this is appropriately portrayed to the public.

Another best practice for constructing the document itself is to include a summary of existing “knowns” or findings from data. This helps to contextualize the arguments in favor of combining the work of two disciplines and striving to correct some of the health issues linked to the built environment. This information should include health data and “non-health data” that characterizes conditions in the community. The narrative should also include health priorities obtained from community outreach and the study of the existing health conditions. The health topics most important to the community should also be tied to the goals and objectives included in the plan.

The literature also included common mistakes to avoid in these efforts, from the initial stages of the project through to implementation. This includes linking surveys and other outreach to goals and policies, which will better support the democratic nature of the planning effort and result in a plan that can be implemented. Also, strategies should be utilized to better integrate health data into the progress of the goals, and use of this information to direct resources and track progress.

Connect priorities to public health. Also related to implementation is the awareness of timing and context, which should be kept in mind for the “next steps” in the project.

SELECTED FINDINGS AND PROJECT IMPLICATIONS

- As the best practices research suggests, goals included in the Community Health Plans should include multiple components and actions, which will better address the breadth of influences on behavior and health.

- The literature review above demonstrates an understanding of the links between public health and planning, and these connections should be part of the educational component of the project throughout community outreach efforts.
- There should be a focus on communicating the impact of root determinants of health, which will help to contextualize the efforts for community members and evoke local knowledge on specific issues related to the topic.
- Throughout the outreach process, and as part of the document, data that describes health conditions and other community data should be integrated in order to provide a convenient way of understanding what the plans seek to address.
- The plan should include ways of measuring progress, next steps, and increase the communication lines between public health, planning, and information available to the community.

Case Studies

Existing health elements in California were examined through a set of criteria to determine which plans will be used as models. A matrix for the elements chosen as case studies was completed to illustrate evaluation criteria to choose a model for the community health plan. The matrix contains evaluation categories to include plan scope, planning outreach process, population size, demographic makeup, extent of goals and policies, implementation strategies, and notable or exceptional aspects. Results of this matrix helped to determine which two or three health elements were used to shape the Cayucos Community Health Plan.

SELECTED FINDINGS AND PROJECT IMPLICATIONS

- Policies and goals must be community appropriate, taking into account the socio-economic and demographic makeup of the respective community; failure to do so may make some policy solutions ill-fitting.
- Documenting the outreach process and findings in the planning document is a vital component for generating public support for the community health plans; failure to do so may alienate the community and make the project to appear top-down without community input.

Research Question

This project seeks to answer the following research questions:

- What affect do the existing features of the built environment and land uses found in each respective town have on public health?
- What are the unique built or natural environment features, political, cultural or community factors/barriers that may be playing a role in affecting health outcomes?
- What community appropriate strategies and recommendations would provide the greatest benefit in producing positive health outcomes?

METHODOLOGY

METHODOLOGY

Introduction

The objective of this professional project is to begin looking in-depth at the ways the built environment (our streets, parks, and neighborhoods) contributes or detracts from the health of the community through focus on a small yet cohesive part of the San Luis Obispo County: Cayucos and Oceano.

The creation of a scope of work for the project was achieved through the development of the prospectus. Preliminary literature review, direction from the client, and discussions with key groups and individuals helped to determine the scope and schedule of the product. The committee, which includes the client, reviewed and approved of the final scope of work at the prospectus defense meeting. Many methods were employed in both communities, though the unique aspects of each community were considered and resulted in slightly different methods in each. Consulting with the client and key stakeholders occurred throughout the process, adding to the completeness of information in the background report and ensuring that the final product addresses the needs of the community.

The methods were decided based on questions to be answered throughout the development of the project, and the identification of sources of information that would help to answer the questions(see Table 3 and 0 of pages 45 and 46).The development of this these projects had several stages which were divided into three phases. The first phase, information gathering, included case study analysis and compilation of a background report. The second used background information to design and implement an outreach plan. The third was to write a set of findings, policy recommendations, and implementation measures that make up the community health plan.

Table 3 Oceano Information Sources

Project Questions and Information Sources/Methods	
What have other cities done to address the built environment and public health?	
Sub-questions	Answer Sources
What other cities have incorporated a stand-alone PHE into its General Plan?	The Governor's Office of Planning & Research's Annual Planning Survey Results – 2012 Edition
Of the cities identified above, are there any comparable communities to Oceano (i.e. population, demographics, et cetera)?	U.S. Census
What is the scope, policies, goals and strategies typically included in a PHE?	San Pablo General Plan - 2030 City of El Monte General Plan
Are there any unique recommendations or aspects that would be appropriate for Oceano?	[Identify Specific Case Studies]
What particular outreach efforts or strategies were used to garner public feedback and participation in the developmental stage of the PHE?	County of Santa Clara County Planning Office Building a Healthier Coachella Valley
What are the existing conditions in Oceano?	
Sub-questions	Answer Sources
What are the basic profile statistics (age, ethnicity, gender, family status, employment status, etc.) on Oceano?	U.S. Census, SLOCOG
What is the community's health status?	
What are the leading causes of death? Who are the vulnerable populations? What are the obesity and diabetes rates? What are the rates of asthma and other respiratory problems?	San Luis Obispo County Public Health Department Environment and Obesity in San Luis Obispo (2008) Air Pollution Control District SLO County
Are there any existing environmental hazards (i.e. air quality, toxic ground and water containments)?	
Infrastructure	
Does Oceano currently have adequate sidewalks, interconnectivity between neighborhoods and service areas, bike paths, et cetera?	GIS, County Planning Department, field work/inventory, County Public Works Department, Community Outreach
Opportunities for physical activity?	
What are basic count of public parks, open space and recreation facilities in Oceano? Are residents in close proximity to these areas? What percentage of residents is located within a quarter-mile to a park?	GIS, County Planning Department, field work/inventory, County Public Works Department, Community outreach
Is there a mix of land uses? Do residents have safe and easy access to retail stores, schools and services?	
Access to nutritious food options?	
Are there healthy food options (farmer's markets, produce markets, community gardens, etc.)? Is there easy access to them?	http://www.publichealthadvocacy.org/RFEI/presskit_RFEI.pdf and Community outreach
How many fast food restaurants and convenience stores are in the community?	
What is the retail food environment index (RFEI)?	
Context-appropriate goals, policies, strategies?	
What goals, policies and strategies are supported by the community /suggested by?	Community outreach

-----------------------------	----------------------------------

The following sections explain the three phases that served to answer the research questions and complete the plan. The methods discussed in this chapter include:

- Phase I: Data Collection and Analysis
 - Literature Review
 - Existing Conditions Analysis
 - Physical Inventory, including access maps and studies on walkability
 - Case Study Analysis
- Phase II: Community Inventory and Outreach
 - Stakeholder Analyses
 - Presentations to Local Government Agencies
 - Key Informant Interviews
 - Questionnaires
 - Public Events
 - Plan Draft Review Meetings
- Phase III: Goals Policies, and Implementation Recommendations
 - Goals and Policies
 - Implementation Measures

The subsequent documents that immediately follow this section provide the specific details, strategies and findings for each community that relate to and resulted from the various outlined methodological approaches mentioned in this section.

Phase I: Data Collection and Analysis

This phase included a literature review, collection of census data, county public health data, and analysis of conditions of the built environment.

LITERATURE REVIEW

The first step in data collection and analysis phase was to conduct a review of available literature on the correlation between health and the built environment. This was accomplished through the review of professional and academic articles, for the purpose of studying connections between the built environment and health, as well as best practices for achieving healthier communities. This involved identifying state-of-the-art practice from planning documents, practitioners, planning awards, professional associations, and professional publications. In addition, plan examination through a methodological perspective served to identify strengths and weaknesses of contemporary practice. This portion of the project helped to determine the components of the final product and ensure a well-informed final product completed using best practices. The literature review, summary of the readings, findings and relevance to the project community can be found in section Literature Review section of this document.

EXISTING CONDITIONS ANALYSIS

Information about the communities' socio-economic traits, demographic information, and an analysis of the built environment is included in this step. It helped to provide a basis for the criteria used to assess other health elements and the development of

implementation and policy recommendations. Most data was taken from previous surveys and studies, including US Census data, the ACTION for Healthy Communities Report (a countywide survey report), existing planning documents, and various other sources of publicly-available data. This part of data collection and analysis was limited because both communities are unincorporated towns. Some data was available for Cayucos and Oceano individually, but much of the data was compiled as county-wide or unincorporated areas.

Physical Inventory

To augment available health and demographic data, a physical inventory was conducted to achieve an understanding of the existing built environment in Cayucos and Oceano. This process included a walkability audit, and food, parks, and hydration station access assessments.

Walkability Audit

A walkability audit was conducted in Cayucos to provide an objective evaluation of the walking environment. The information collected was used to identify pedestrian concerns related to safety, access, comfort, and convenience. This was especially important as a factor involved in the availability of transportation-based physical activity. The method for the audit was chosen for its scale and purpose.

Numerous features of the built environment have been associated with physical activity, including residential density, land-use mix, urban sprawl, intersection density, walkability, park availability, and accessibility to physical activity-related resources. (Casagrande, S., et. Al. (2011). Association of Walkability With Obesity in Baltimore City, Maryland. December; 2011 101(Suppl 1): S318–S324). This audit was used to evaluate several qualitative spatial factors that contribute to walkability. To complete this analysis, an

existing spatial analysis tool, the Pedestrian Environment Data Scan (PEDS) was utilized to quantify the qualitative aspects of the Cayucos walking environment, including sidewalks quality, traffic, land use patterns, building accessibility, safety, cleanliness, amenities, the degree of urban enclosure, among other factors.

The Pedestrian Environment Data Scan (PEDS) is an instrument that was developed in 2004 by Dr. Kelly Clifton, University of Maryland; Andria Livi, University of Maryland; and Daniel Rodriguez, University of North Carolina, and supported by a grant from The Robert Wood Johnson Foundation Active Living Research program. The scope was limited to the commercial center of Cayucos, Ocean Avenue and D Street. The audit captures microscale features that are apparent to pedestrians but not easily captured in public data. The data collection instrument is a survey consisting of 36 objective and 4 subjective analysis criteria that the surveyor uses to catalogue the area through six categories: Environment, Pedestrian Facilities, Road Attributes, Bike Facilities, Walking and Cycling Environment.

This particular walkability audit tool was used because of the variety of factors and topics, which included elements of safety, pedestrian suitability and bike-friendliness, as well as elements of urban design. Though the topics are widespread, the number of questions is relatively few—36 questions in all, including a subjective assessment. Some audit tools included over 100 questions. The tool was also user-friendly in that the paper form for use in the field was publicly available, as well as an Audit Protocol guide. The creators of the PEDS audit tool also studied the association between pedestrian activity and the built environment by creating a behavioral model. The study concluded that the PEDS tool can fill a longstanding gap that has impeded the progress of pedestrian research and practice and represent a positive step toward elevating walking as a mode

of transportation and source of physical activity (Clifton, Smith, and Rodriguez, 2007, pp. 95-110).

The process for the walk audit was comprised of several steps. First. The study region was determined and mapped. The analysis area for this study instrument included 30 segments in and around the core of Cayucos. Study streets were mapped, coded, and printed for reference in the field. Two researchers underwent self-training by reading through and discussing the instructions for the PEDS analysis tool. The walkability data collection component was completed in the field. The PEDS Data were then encoded into Excel. Though the PEDS survey instrument has been developed and used in the field to collect data, a standard evaluation system for PEDS has not been created. A scoring system was created by assigning a zero to two rating to each survey criteria as outlined in the following chart. The walkability scores for each segment were then determined by combining these ratings and normalizing the aggregated numbers by comparing them to a highest possible score in each of the categories analyzed. The categories analyzed and mapped by the project team include overall walkability, safety, ease and comfort of travel and aesthetics. The tables were joined to the original roadway data and color coded on a gradual scale to show the individual street walkability figures. The walkability figures were then overlaid onto the spatial data allowing for visual correlation with features of the spatial environment. The detailed information for the walkability audit is available in Appendix A: Physical Inventory.

Walkability Information in Oceano

A walking audit was not performed in Oceano as Safe Routes to School San Luis Obispo had recently published the findings of its own infrastructure survey that provided an audit of the half-mile area surrounding Oceano Elementary. Due to Oceano's small

size, the central location of its elementary school, and thoroughness of Safe Routes to School's data, it was deemed unnecessary to conduct an additional audit. The results of this study are outlined in the Oceano Findings section.

Food and Park Access Assessment

The food and parks access assessments were included in each Health Plan in order to analyze the existing availability of food outlets and to help determine need. The assessment was conducted using GIS data collected from San Luis Obispo County and by visits to each of the stores that sell food or beverages.

To depict and visualize healthy food retail and recreational park access, ArcGIS 10.2 and the network analyst extension were utilized. For the analysis of the food retail environment, data was obtained from the local environmental health department to determine the location and type of stores that exist in the study area. Once a list of existing stores was determined, field work was done to gather in situ data to confirm the accuracy of addresses that were provided and also survey the availability of fresh fruits and vegetables. Similar methodology was used for recreational parks, where the location of parks was identified through aerial imagery and was confirmed through field work.

After the location of the food retail stores and recreational parks were confirmed in the field, the locations were geocoded. The geocoded retail stores and recreational parks were used in conjunction with a road network file to calculate service areas. Because the road network file had no connectivity, a network dataset was made to establish connectivity within the road network file. Once connectivity was established, a quarter mile and half mile service area from recreational parks, and a half mile and one mile service area from food retail stores were determined and visualized. By utilizing network analyst, distances from retail stores and recreational parks were calculated based on

Manhattan distances versus Euclidean distances, reflecting realistic paths an individual may use.

Hydration Station Access Assessment

Empty calories consumed daily from sugar-sweetened drinks, which include non-diet sodas, fruit drinks, smoothies and any other beverage that uses sugar as a primary additive. One study found that replacement of sugary beverages could cut up to 235 calories per day for the average American child's intake (Wang, Ludwig, Sonnevile, & Gortmaker, 2009).

Empty calorie intake from sugar-sweetened beverages has been identified as a major contributor to the obesity epidemic in the United States (Kushner, 2013, p.1). Water, the healthiest calorie free alternative, is not being consumed enough by U.S. children and adults, according to recent research findings (Goodman, Blanck, Park, Nebeling, & Yaroch, 2007). Drinking fountains (i.e. hydration stations) are publically accessible water sources that are traditionally found in parks, trails and open spaces in most communities. A small but increasing number of local government agencies are starting to address concerns over public drinking fountain access through comprehensive planning (i.e. general plans), municipal codes and direct initiatives to ensure free water in public spaces in their respective communities.

It was determined a hydration station assessment should be included in the physical inventory to map water fountains and other public sources of drinking water. Field reconnaissance was conducted to confirm an accurate inventory of the hydration stations in the town.

Case Study Analysis

Due to the difficulty of finding relatable strategic health plan documents to model after, existing health elements found in both city and county general plans across California were used as case studies to help develop each Community Health Plan. The final component of this phase was to review and evaluate health elements using a set of criteria. The unit of analysis is defined as *the who or what being studied*. For this project, the unit of analysis is health elements in general plans, which was reviewed, analyzed, and used as a model for creating a small-scale, context-sensitive version for the communities of Cayucos and Oceano. Existing health elements in California were examined through a set of criteria to determine which plans will be used as models.

An initial audit was conducted to first determine what governments across the state have incorporated a separate or stand-alone health element into its general plan. In the Annual Planning Survey Results (2012) report, the Governor's Office of Planning and Research helped facilitate the process by identifying 36 cities and 13 counties in the state that adopted health elements into their respective general plans. At the time of review, a number of jurisdictions were in various stages of development in the creation of their own health element, with a few waiting for public review and adoption. These were not considered due to time constraints for this project.

Of these 49 health elements, eight documents were initially selected based on a range of subjective cursory criteria including, quality of content, aesthetic appeal, readability and thoroughness. A case study matrix consisting of the eight selected health elements was then created to distinguish evaluation criteria used to determine what health elements would be most useful and relevant in providing modeling guidance for Oceano's Healthy Community Plan. A separate matrix was developed for Cayucos to better reflect

the needs of this other, quite different community. The matrix contains evaluative categories such as: scope of plan, planning outreach process utilized (if any), population size, jurisdiction area (in sq. mi), comparable demographical makeup, number of goals, number of policies, provision of implementation strategies (if any), and unique or notable plan aspects. Additionally, new health aspects and topics not found in current health elements were incorporated into the final document where deemed relevant and community appropriate. Results of this matrix helped to determine which two or three health elements were used to shape each community health plan. The comparative figures for each community are provided in the matrices which can be found in Appendix B: Case Study Analysis.

Case Studies for Oceano

Based on the criterion provided in the matrix, as well as other nuanced qualitative aspects (aesthetics, quality of content, et cetera), two stand-out health elements were selected for further in-depth case study analysis: the City of San Pablo's *Health* Element and the City of South Gate's *Healthy Community* Element. The format, structure and content of these health elements were determined to be specifically relevant, appropriate and applicable to the town of Oceano for a variety of reasons. First, while there are currently no existing health elements that are written for a community with as small a population as Oceano, both health elements were deemed comparable due to their similar demographic, with all three possessing large or predominantly Hispanic or Latino populations. Second, both case study cities have similarly small land areas, with San Pablo being 2.634 square miles and South Gate at 7.353 square miles, in comparison to the 1.547 square mile footprint of Oceano. Finally, consideration was given to South Gate's health element due to the fact it contained stated goals, objectives and policies, as well as details regarding community outreach efforts in the development of the

document. San Pablo's document was perceived to have added value in that a matrix was provided that looked at aspects found in other elements within the general plan and how they related to public health. In addition, San Pablo's health element was unique in that it provided implementation or action strategies to enact policies.

Case Studies for Cayucos

For construction of the Cayucos Community Health Plan, three health elements were selected for in-depth review and served as a model: El Monte Health and Wellness Element, the San Pablo General Plan, and the Emeryville Public Health Element. Plans were reviewed first and foremost for innovative concepts and thorough approach to this topic, including public outreach efforts, the presence of implementation, and cost and phasing details. El Monte makes a strong case for the connection between public health and the built environment, starting by providing useful tables that number how many convenience, liquor, and fast food restaurants are in the area. It also provides informative blurbs that define key terms for the reader, and a reference list at the end of the document for further reading or research. Emeryville's PHE is found as subsection ("Environmental Health") under the Sustainability section of its GP. Emeryville has been a leader in sustainable design practices in an effort to curb reliance on fossil fuels, decrease consumption of natural resources, and reducing practices that contribute to climate change. Public health is addressed through transportation, increased pedestrian and bike pathways, and specified purchasing and consumption as strategic ways to improve public health and access to healthy foods. Population size was considered as well, although there were no plans found for a town as small as Cayucos. Because the beach and ocean are such a strong part of the character and draw of Cayucos, elements from beach or waterfront communities were also considered as criteria. Emeryville is a waterfront town, though not a beach community. Lastly, it was important to consider

using different consultant authors in the selected elements in order to combine the best, most effective components.

Phase II: Community Inventory and Outreach

This phase augments information from Phase II and provides further direction for assembling background information. The goal of outreach is to garner valuable perspective and feedback from community members regarding physical activity levels, information about the built environment where they live, work, and play, and perceived barriers to healthful activities and food access. Data is qualitative in nature and questions were developed with the intent of seeking local knowledge.

The outreach plan was informed by the data collection and analysis phase. Information related to the relationship between health and the built environment, the existing health conditions and built environments of Cayucos and Oceano, and the outreach processes conducted for other health elements were used to modify the draft outreach plans included in this document. In addition, a stakeholder analysis was conducted for each community Health Plan, and is included on the following pages (Table 5 and Table 6, Pages 58 and 59).

Table 5 Cayucos Stakeholder Analysis

Target group	Organization	Engagement Venue	Type	Purpose
Government agency	Advisory Council	Community Meeting	Public Meeting	Disseminate Information/generate ideas

Oceano Community Center (Day of the Child)	Community members	Presentation	Disseminate information/collect feedback

PRESENTATIONS TO LOCAL GOVERNMENT AGENCIES

Presentations were scheduled with local government agencies of both respective communities. The purpose of these presentations were to announce our presence in each community, to state what our intentions would be while working there, to provide the scope and details of our project and ask for their support, as well as to request information and field questions. This was determined to be an important initial step that was necessary prior to the start of any public outreach efforts.

As unincorporated towns, Oceano and Cayucos lack typical local government bodies such as a city council and planning commission. As such, it was determined that scheduling presentations before the town's primary local government agencies, the Oceano Community Service District (CSD), and the Oceano Advisory Council (OAC) in Oceano, and the Cayucos Citizen Advisory Council in Cayucos, would be an important initial step to be made prior to the onset of any project related work. The Oceano CSD is a multi-service special district that serves both residents and business people of Oceano and neighboring unincorporated community of Halcyon with fire protection, sewer, water services and street lighting. The OAC and the CCAC serve as liaisons between the unincorporated town and the County Board of Supervisors, promoting community involvement and awareness of planning and community development issues, acting in an advisory capacity and not as an approval board.

Cayucos Citizens Advisory Council

Meeting with the advisory council was the first step in the Cayucos outreach process. It included correspondence with the Cayucos Community Advisory Committee chair prior to the December meeting to secure a time on the agenda. The presentation was organized through a PowerPoint presentation to inform the group about the project, the

regulatory framework, and the role of the CCAC. Preliminary questions were also asked of this group. They included:

- What days are best to conduct outreach?
- What times and days do most people attend events (especially local government events that are not that fun)?
- What other organizations are involved/know a lot of people in Cayucos?
- Any pressing health issues that you know of that might not readily show up in survey/reporting results?

The presentation was meant to introduce project, meet the committee, and receive direction from this key group of stakeholders. The outcomes of the meetings with the local government agencies are detailed in the Findings section for each community.

KEY INFORMANT INTERVIEWS

Key Informants were instrumental in gathering local knowledge in both communities. A small number of individuals deemed to have specialized or in-depth knowledge of their respective communities were identified prior to initiating the interview process. Many of these individuals were known in advance as potential candidates to approach, but a few of the interviews came about organically through the recommendations of others, including other key informants themselves. Representatives from the advisory councils, School District, PTA, and community groups were interviewed regarding health issues, community priorities, assets and factors contributing to health, and barriers to improving health in the community.

With assistance from the project's client, a key informant questionnaire was developed in January and February. The questionnaire consisted of eight primary questions with

additional follow-up questions dependent on how the subject answered the initial probing question. The questionnaire was utilized as a script, but could be deviated from as the conversation and direction of the discussion dictated it. Most interviews were conducted over the phone, though some were held face-to-face. The details and outcomes of these interviews can be found in the Findings chapters for Cayucos and Oceano.

QUESTIONNAIRES

A questionnaire was drafted and approved by client and advisor in February, 2014 and distributed throughout February, March, and April in an effort to gather quantifiable data that would provide an indication of community health levels, access to healthy foods, and sentiments regarding the built environment in Oceano and Cayucos. The questionnaire was developed and distributed in an effort to gather quantifiable data to give an indication of community health levels, access to healthy foods, and sentiments regarding the built environment in Cayucos and Oceano.

The questionnaire was distributed to any resident of or worker in each of the communities. Effort was made to avoid distributing the questionnaire to infrequent visitors, although some visitors to Cayucos were included, especially if they had strong ties to the community, such as owning a vacation home or visiting family members. Because the questionnaire was not distributed to a sampling of either community, it cannot be called a proper survey. However, an effort was made to reach out to each segment of the community through visiting several locations in each town at different times of day, on both weekdays and weekends. Other methods of outreach, as described further in this section, also were prioritized in order to gather information from different types of people and several groups within each community.

Some of questions were posed in a scaled answer format in order to better be able to place the respondents in a continuum to provide more nuanced data. The questionnaire was also translated to Spanish in order to better reach Oceano community members. The questionnaire was posted online through Survey Monkey to reach a wider range of residents in both towns. The remainder of questionnaire distribution was through “guerrilla” planning visits to parks, grocery stores, and community gatherings to reach residents. A copy of the questionnaire is included in Appendix C: Outreach Materials. Questions included:

- What contributes most to your quality of life in Cayucos/Oceano?
- What do you think makes it most difficult to be healthy or detracts from overall wellness here?
- What would you want to change in Cayucos/Oceano that could contribute to your personal health or the health of community as a whole?

Questionnaires in Oceano

In Oceano, questionnaires were informally conducted at predetermined locations of high pedestrian traffic such as Central Market and La Tapatía Market & Deli, as suggested by the aforementioned local government agencies. Community based groups such as the S.A.F.E. Oceano Healthy Start - Family Resource Center (hereafter: Family Resource Center), Oceano Community Farmers’ Market (OCFM) and the Oceano Elementary Parent-Teacher Association (OPTA) were also identified as initial target groups to survey. As described by the Parent Connection of San Luis Obispo County website, the Family Resource Center is a school district linked group that coordinates community resources to keep children “safe, healthy, at home, in school and out of trouble” (Parent Connection of San Luis Obispo County, n.d.). The OCFM is a committee of Oceano

residents seeking to establish a seasonal, weekly open-air farmers' market, where it is envisioned residents and visitors will be able to purchase fresh produce and learn about healthy living (Charlton, 2013). The OPTA is a formal organization intended to foster interaction and participation of parents of Oceano Elementary students concerning the "welfare of children and youth in home, school, community, and place of worship" (California State Parent Teacher Association, 2014). Both the Family Resource Center and OCFM were inviting and interested in the project, finding common ground with the general promotion of health for Oceano residents and over concerns regarding access to healthy foods. It should be noted, despite multiple efforts through correspondence, there was a failure to elicit interest in the project or survey with the OPTA.

The relationship established with the Family Resource Center proved especially beneficial for this project being particularly connected with the Hispanic and Latino population, the group possesses a far-reaching influence within the community. They showed great interest in assisting with the project, volunteering time and effort to help conduct the surveys. This task was accomplished by dispersing surveys to their constituents, door-knocking and other informal methods to complete the questionnaires.

Questionnaires in Cayucos

In Cayucos, the Healthy Communities class at Cal Poly (CRP 470) assisted with this portion of outreach. As part of the curriculum, the class learned about the projects, practiced outreach methods, and visited three locations to conduct questionnaires on February 21, 2014. The locations were chosen based on proximity to community destinations and spaces. They included 1) the pier and beach, near the Vet's Hall and several restaurants and retail locations, 2) the library, Hardie Park, and Cayucos Elementary School, and 3) the Cayucos Market, near Paul Andrew Park and the Sea

Shanty. Students were provided training in-class, which included a project introduction, a script for administering the questionnaire, and time to practice administering the questionnaire among their peers. Questionnaires were also distributed to all members of several community groups, including the Cayucos Senior Club, Cayucos Lioness Club, Rotary, and the Cayucos Elementary Parent-Teacher Association. In addition, information about health and the project was distributed to each questionnaire participant. This was attached to a somewhat-healthy treat of individually wrapped trail mix, and included a link to the survey monkey questionnaire and an invitation to encourage the participant's family or friends to participate.

PUBLIC EVENTS

Cayucos Community Group Meetings

In order to efficiently gather feedback from community stakeholders, several community groups were contacted to arrange a meeting to discuss the Community Health Plan. Of those contacted, four groups arranged a meeting: the Cayucos Elementary Parent Teacher Association (PTA), the Lioness Club, Rotary, and the Seniors Club, all of which included a presentation about the project and group discussion. Presentation materials can be found in Appendix C: Outreach Materials.

Questionnaires were distributed to individual group members at each meeting. In a large group or in smaller groups, three questions were posed for a short discussion. The questions were:

- What are the top three contributors to the health of the Cayucos community?
- In your experience, what are the top 3 most important health issues in Cayucos?

- What solutions might you propose to increase physical activity, healthy eating, or to address other “root determinants” of health?

The small groups were then asked to share with the larger group.

Cayucos Farmers Market: Public Space Improvements

Graduate students in the City and Regional Planning Program at Cal Poly, San Luis Obispo conducted a planning process for the purpose of preserving and improving public space within Cayucos. The project is entitled "Connecting Cayucos: Visions and Actions for Public Space." The proposal includes ideas for parks, streets, and other public spaces. It also considers issues related to parking and economic vitality. This project provided additional public outreach opportunities and community input that helped to inform the Cayucos Community Health Plan.

Outreach included a voting exercise to find out about the desires and needs of community members and visitors, and took place at the Cayucos' Farmers Market on May 23 and May 30th. The studio project centered on five main themes as ways of “Connecting Cayucos” through community identity, accessibility, natural resources, health and safety, and economic vitality. These themes were addressed throughout the options for public space improvements illustrated for voting purposes.

Cayucos School Outreach

Activities at Cayucos Elementary were conducted on May 24, 2014, in conjunction with the graduate studio class. Cal Poly students brought materials to engage a group of eight graders through a mapping activity. The mapping exercise involved students selecting cutout images of things that were representative of what they liked to do for physical activity; things that would make them feel safer; and things they “wished” were

present in Cayucos. Students were also asked to indicate the travel mode and route they took to school. The exercise concluded with each group collectively discussing the features they would most like to have in Cayucos.

Oceano Elementary Event

On February 21, 2014, a survey and mapping exercise was conducted with Mr. Jim Dececco's 6th grade class at Oceano Elementary. Volunteers from Prof. Kelly Main's City and Regional Planning (CRP) 470 class helped facilitate the event. The primary purpose of the event was to get a better understanding of what Oceano children do for physical activity, their eating habits, and inquire about what types of things would potentially motivate them to become more active

A brief survey was conducted prior to the start of the mapping exercise. Along with basic demographic information (gender and age), the questionnaire was comprised of six questions and was developed with the help of the project's chair. Students were asked to complete the questionnaire in its entirety, but informed they didn't have to answer any questions they were unsure of or not comfortable answering. CRP volunteer assistants were available to explain survey questions, but were careful not to guide students into answers.

The class was broken up into small groups for the participatory mapping exercise. Students were asked to select from a pile of images the types of things that represented what they do for physical activity, things that would make them feel safer, and things they would like Oceano to have. They were then asked to glue in place the images on the map relative to where they do the activity or where they would like to have the feature located. Students were also asked indicate the general location of where they lived in the community and the mode of travel and route they took to school and back. At

the conclusion of the exercise, each group discussed collectively built environment features they would most like Oceano to have.

Oceano Day of the Child Event

On April 27, 2014, an information booth was reserved for the Day of the Child event held at the Oceano Community Center in Oceano. This free annual event features local nonprofit, community and government agencies concerned with nutrition, exercise and healthcare for children. Easels featuring large graphs of survey results were presented to the public, as well as a PowerPoint presentation that included photos and a description of the mapping exercise held at Oceano Elementary. Additionally, a large scroll of blank paper was provided on the table and visitors were asked to list built environment features they wish they had in Oceano. Lead group members of Oceano S.A.F.E. assisted at the event.

PLAN DRAFT REVIEW MEETINGS

Outcomes of the outreach process determined the direction of goals, implementation measures, and policy recommendations. The last outreach efforts involved returning to the community with draft goals, policies, and implementation measures for review.

Plan Draft Review in Cayucos

In Cayucos, the final outreach efforts involved returning to the community with draft goals, policies, and implementation measures for review. This process occurred first at an event in a community gathering space, the Veteran's Hall. This event was a joint effort conducted for the purposes of this project and Professor Main's Graduate Studio Class, which focused on public spaces in Cayucos. Because the topics overlap extensively, feedback was gathered for both planning efforts. The feedback from these

efforts further informed the project about specific community concerns, perceptions, wants and needs, and strategies for improving spaces and would like incorporated into their community. The community feedback was recorded, analyzed and considered in the process of drafting initial policy language.

Plan Draft Review in Oceano

A final event was held on June 23, before the Oceano Advisory Council to present the community with a draft of created goals, policies and action programs developed for Oceano. This event will seek the community's input and record the responses and attitudes towards the policy language outlined in the Health Plan draft. That feedback will then be used to further modify the document accordingly as appropriate.

PRESENTATION TO SAN LUIS OBISPO COUNTY HEALTH COMMISSION

The project was also presented at the San Luis Obispo County Health Commission meeting on June 9, 2014. The Health Commission meeting provided a forum for public presentation of the final plan, and was televised locally and via web-streaming.

Phase III: Goals, Policies, and Implementation Recommendations

GOALS AND POLICIES

The result of Phase I and II informed the process of creating goals for the communities. These goals refer to those that the community may be able to reach without the adoption of a health element into the County general plan. The goals will synthesize those concerns and desires said by the community during the outreach process, as well as information on existing conditions in Cayucos and Oceano.

Using outreach results and background information, synthesized goals and policies were developed to increase the capacity for improving the state of health in the built environment throughout the county. These include proposed changes to the San Luis Obispo County General Plan. These considerations serve as a “next steps” portion of the document, and may be helpful to interested parties for gaining traction at the policy level.

IMPLEMENTATION MEASURES

Based on goals and policies, implementation measures were outlined to achieve changes in the built environment that will improve community health. They were created using information gathered in Phase I, and modeled after aspects from existing health elements considered to be best practices for Cayucos and Oceano, as determined by the case study matrix. Health aspects unique to the communities, as based on findings in Phase II, were also incorporated.

EXISTING CONDITIONS

EXISTING CONDITIONS

The following sections serve to describe the health conditions in Cayucos and Oceano. This summary of health conditions in Cayucos, Oceano, and San Luis Obispo County comprises data and findings outlined in the 2013 ACTION for Healthy Communities Report, released in 2014 by the Community Foundation, public school survey results, public health data, and information from applicable existing plans. Existing Conditions topics include the following:

- Demographic information including age, income, race, and educational attainment for each community
- Housing and transportation data for each community
- Death rates by community
- Data on Physical health, countywide and by region
- Physical activity measures and levels, countywide and by community
- Mental health and wellbeing
- Substance use, countywide and by region
- Food Access and eating habits, countywide and by region
- Environmental Quality
- Public Safety, countywide and by region
- Area Plan Analysis
- Oceano Revitalization Plan and Oceano Specific Plan
- Local Coastal Plan information

As noted in the Methodology Chapter, there are some limits to this information due to the fact that both communities are unincorporated and data is generally only available for the individual cities in the county, with all unincorporated areas presented in aggregate. Community-specific information was taken largely from 2012 US Census data. Implications for Cayucos and Oceano are summarized below.

Cayucos Demographics

POPULATION AND HOUSING

There are 2,431 Cayucos residents in the 3.1 square mile community boundary. From 1970 to 1990, the population grew 67% from 1770 to 2960. In 2000 the population was 2,943, a decrease of 12%. The growth of Cayucos and nearby communities has been limited since the 1980's due to utilities limitations such as water supply in Cayucos and sewage disposal in Los Osos. While permanent residents have decreased, the number of housing units has grown, suggesting a growth in seasonal residents not shown in the census. Cayucos currently has 2,354 total housing units and 1,040 vacant housing units, making up 44% of the total housing units. Fifty percent of units are vacant, probably due to the use of units as vacation homes and vacation rentals. Much of the vacancy rate can be explained in the 893 seasonal, vacation use homes or second homes. There are 1,214 households, with on average two people per household. Cayucos has a high rate of owner-occupied units at 70%, which is about 20% higher than the county rate. Seventy-four percent of owner-occupied units are valued at 500,000 or more, and 22% are over one million, which is more than double the county rate of 7%.

AGE

The median age in Cayucos is 57.2 about 1.5 times that in San Luis Obispo County, where the median age is 37.4. Sixty-five percent of residents are over fifty years of age, and 76% of residents are over forty. The number of Cayucos residents under the age of 18 is 337, comprising only 13% of the population. This number has decreased from 17% in 2000, which illustrates the trend toward an aging population. Almost 10% of Cayucos residents are military veterans, about 1.5 times the rate of California overall (6.5%).

INCOME AND POVERTY

Income overall is high in Cayucos, with per capita income at \$42,000 per year. This is about 1.4 times the amount in the county and California overall, which is about \$30,000 per capita. Median income is a little higher than the amount in the County and California. However, higher incomes are more prevalent in Cayucos than in the county overall. The percentage of Cayucos households with an income of \$50,000-\$100,000 is 10% higher than the county at about 1/3 of households, and the percentage with an income of \$100,000-\$200,000 is 20% higher at one quarter of the population. Approximately 81.6% of those who work in Cayucos travel outside of Cayucos to reach their place of employment, making Cayucos a “bedroom community”. Tourism is an important economic driver in Cayucos. Most businesses cater towards local residents and tourists’ retail and service needs. Cayucos is home to many home vacation rentals, as well as 12 hotels and motels (U.S. Census Bureau, Census Bureau, 2008-2012 American Community Survey, 2011 ZIP Code Business Patterns). The poverty rate, however, is higher than that of the County at 15.8%, as opposed to the County’s 13.7%. Twelve percent of seniors 65 and over are below the poverty line, more than double the rate in the County as a whole. Children under 18 also have a high poverty rate in Cayucos at

36%, which is also more than double that in the County, and 1.5 times the rate in California as a whole. It is important to note that these statistics could be skewed by the small sample size surveyed in Cayucos.

RACE, ETHNICITY, AND LANGUAGE

The community in Cayucos 87% white as reported in the 2010 census. This rate is about 25% higher than San Luis Obispo County, and more than double the rate in California as a whole. Hispanic respondents of any race were represented at 7% of the population, and 3% responded Asian. Cayucos residents also speak English at home almost exclusively, with 3% of the 18 and over population speaking Indo-European languages, and 2% of the population speaking Spanish at home among adults 18 and over. The percent speaking English at home is nearly double that of California overall.

TRANSPORTATION

Highway 1 serves as the principal arterial or main access roadway to both the northern and southern portions of Cayucos. The central street of the town, Ocean Avenue, is classified as an arterial roadway, serving as the major artery of Cayucos. Other major roadways, classified as collectors, include Cayucos Drive, Pacific Ave, 13th Street, 24th Street, Studio Drive, and Old Creek Road. All other roadways within the town are classified as residential, designating lighter and slower vehicular traffic. Commercial activity is mostly restricted to the CBD and along Ocean Avenue, the main route into the CBD (Estero Area Plan, 2009). Mean travel time to work in Cayucos is similar to the figure for county residents at 18.2 minutes, and about 10 minutes less than the mean travel time for California as a whole. Mode of transportation to work was also comparable to that of county workers with 75% driving alone. Fourteen percent carpooled, as opposed to 11% countywide. Cayucos currently has one bus route that

serves the community. The San Luis Obispo Regional Transit Authority (SLO RTA) bus route 15 passes by the town of Cayucos. There are four main stops in Cayucos heading northbound and southbound.

EDUCATION

Educational attainment in Cayucos is high, with 94.5% having attained a high school diploma or higher degree of education. This is higher than both the county rate of 91.3% and the statewide rate of 81%. Residents hold bachelor degrees at a rate of 40.5%, compared to 30.5% in California. Seventeen percent of residents hold a post-grad degree, compared to 12% in the county and 11% in the state.

Oceano Demographics

POPULATION AND HOUSING

There are 7,286 Oceano residents in the 1.547 square mile boundary. There are 2,603 households, with nearly three people (2.80) per household on average. Forty-four percent of households are married couples, which is slightly below the County and state percentages of 48.7 and 49.4 percent. In Oceano 34.5 percent of households are non-family, compared to 22 percent in the county and 15 percent in California overall. There are an estimated 3,081 housing units in Oceano, with an occupancy rate of 88.7%. A large mobile home community accounts for 23.8 percent (732 units) of the total housing units in Oceano. 90.7 percent of the homes in Oceano are valued at \$500K or less; 62.4 percent of the homes are valued less than \$300K, a figure which is dramatically higher than both county (23.3 percent) and state (36.6 percent) levels.

AGE

According to the 2010 U.S. Census, the median age of Oceano is just 35.4 years old, falling well below the state median age of 45.6 years old. In contrast to Cayucos, only 14 percent of the population is over 50 years of age, and only approximately 20 percent are over the age of 40.

INCOME AND POVERTY

Oceano can largely be considered a relatively young, low-income, community with a median household income of \$41,865 (\$34,938 for Hispanic or Latino) and a per capita income of only \$19,724. These numbers are well below the County's figures of \$59,628 and \$30,218 respectively. According to the 2008-2012 American Community Survey, Oceano has an estimated poverty rate of 16.3 percent, with those identifying themselves as Hispanic or Latino (of any race) at a slightly higher rate of 16.5 percent. In addition, a significant percentage (13.6 percent) of seniors age 65 and older is living below the poverty line; a markedly larger number than the County's figure of 5.8 percent.

RACE, ETHNICITY AND LANGUAGE

The 2008-2012 American Community Survey 5-year estimates indicate 50.7 percent of the Oceano population identify themselves as Hispanic or Latino (of any race). This percentage is approximately 2.5 times greater than the County rate of 20.8 percent. About 45 percent of the population identify themselves as white. At 66 percent, the majority of residents speak English only, with the largest remaining percentage (32.6 percent) of residents speaking Spanish. A large portion (76.8 percent) of the population is not U.S. citizens. This is likely a reflection of the large number of migrant workers in the community.

TRANSPORTATION

The drive-alone rate for Oceano workers age 16 years and over is 69.3 percent. A significantly high percentage (22.1 percent) of workers carpooled to work, in contrast to both County and state figures of 10.6 and 11.5 percent. The percentage of Oceano workers that walked to work (4 percent) is greater than the state (2.8 percent), but less than the County (4.3 percent).

EDUCATION

Educational attainment in Oceano is poor, with just 73.3 percent of the population possessing a high school diploma or higher degree of education. Sixteen percent of residents hold a bachelor's degree or higher, approximately two times less than both the County (31.5 percent) and state (40.5 percent) percentages. Less than five percent of the population holds a post-graduate degree.

San Luis Obispo County Health

The ACTION for Healthy Communities report was a major source of information for this chapter. ACTION for Healthy Communities, San Luis Obispo County identifies community needs and improve health through a collaborative effort. The 2013 report is the sixth update to the project, which began in 1999. The report is helpful because of its comprehensive information, and because it represents a statistically significant survey study of health indicators for the county. The report details overall trends for the whole county, but also gives data separately for four county regions: North Coast, North County, San Luis Obispo, and South County. Cayucos is part of the North Coast region along with Baywood, Cambria, Harmony, Los Osos, Morro Bay, and San Simeon. Oceano is included in the South County area along with Arroyo Grande, Halcyon, Grover

Beach, Nipomo, Pismo Beach, and Shell Beach (ACTION, 2013). Other data was drawn from the US Census, California Healthy Kids Survey, California Department of Health Services, and other publicly available sources.

PHYSICAL HEALTH

In 2011-12, 92% of California Health Interview Survey respondents in San Luis Obispo County said their health was “excellent”, “very good”, or “good,” compared to 87% in 2001. Approximately one-third of Spanish-Speaking face-to-face ACTION survey respondents (31%) and homeless respondents (35%) reported having “fair” or “poor” health in 2013 (ACTION, 2013).

A body mass index (BMI) of 30 kilograms/meter or more is considered obese, and overweight is considered to be a BMI of 25 kg/m or more. According to the California Health Interview Survey, in 2011-2012 48% of adults in San Luis Obispo County were overweight or obese, which was lower than the state of California as a whole (60%).

The county death rate due to cancer declined, though it continues to be the leading cause of death in the county. San Luis Obispo County had higher death rates than statewide rates for stroke, unintentional injury, suicide, motor vehicle accidents, firearms, and drug-related causes (California Department of Public Health, 2014). These trends were similar in Cayucos and Oceano for 2008-2010, where cancer and heart disease were the leading cause of death (See Table 7).

Table 7 Leading Causes of Death by ZIP Code of Decedent's Residence

	Cayucos				Oceano			
	2008	2009	2010	Total	2008	2009	2010	Total
Cancer	10	6	8	24	15	11	10	36
Diseases of the Heart	11	7	5	23	13	7	15	35
Chronic Lower Respiratory Disease	1	2	3	6	2	9	0	11
Injury	1	1	3	5	3	4	0	7
Stroke	2	0	2	4	3	2	2	7
Suicide	0	3	1	4	1	2	2	5

Alzheimer's Disease	1	1	0	2	0	0	4	4
Diabetes	0	1	1	2	1	2	1	4
Chronic Liver Disease and Cirrhosis	0	0	2	2	2	0	1	3
Influenza and Pneumonia	0	1	0	1	1	1	2	4
Nephritis, Nephrotic Syndrome and Nephrosis	0	0	0	0	0	1	1	2
Other	6	4	2	12	8	14	15	37
Total	34	26	28	88	52	53	54	159

(County Health Status Profiles, California Department of Health Services and California Conference of Local Health Officers, 2003-2011).

The percentage of county residents with health insurance and those with a regular source of healthcare decreased since 2010. The percentage of people with an inability to receive medical care due to cost increased, and 73.4% of those without insurance do not have it because they cannot afford it or it is too expensive. In the North Coast region 85% of residents have health insurance, and 35.4% of them have insurance through a state or federal program such as Medicare or Medi-Cal (ACTION, 2013). The nearest hospitals to Cayucos are the Sierra Vista and French Hospitals located in the City of San

Luis Obispo. California Highway Patrol and a privately-owned company provide helicopter transportation to the hospitals. The Cayucos Fire Protection District, the Morro Bay Fire Department, and County Fire all provide emergency medical response to the area, including surf rescue (Estero Area Plan, 2009). In the South County Region, 77.9% of respondents have health insurance, and 28.2% receive insurance through a state or federal program. Oceano has no general hospital or family health center. The closest hospital facility is the Arroyo Grande Community Hospital located in Arroyo Grande. The Oceano Community Service District provides fire and water services for the town (Oceano Specific Plan, 2001). Incidence of teen births and low birth weights decreased in the County, and more mothers reported receiving adequate prenatal care (ACTION, 2013).

PHYSICAL ACTIVITY

Just over half (53%) of ACTION telephone survey respondents participated in five or more days of physical activity for at least 30 minutes in 2013. Five-point two percent reported that they engaged in no physical activity in 2013, down from 6.8% in 2010. When asked if their employer tries to help employees with healthier eating and physical activity, including weight reduction programs, subsidizing health club memberships, or providing stress management classes, 41.4% responded yes, down from 47.9% in 2006. When asked what would help their children to exercise more, 43% of 2013 telephone survey respondents listed activities at school and after-school, 30.4% listed a park or playground closer to home, and 25.6% said safer streets for children to walk to destinations.

The response rate by region shows that there is a disparity between answers for those living in the North Coast region and those in the South County. More people in the South

County responded that housing closer to a school or park would help increase physical activity for their children. More people also responded that awareness of the benefits would help to increase physical activity. In 2013, more North Coast respondents said that a park or playground closer to their home would help, although the percentages for this option changed drastically from 2010 to 2013.

Table 8 “Which of the following would encourage your children to do more physical activity?” Response by Region:

Response	North Coast		North County		San Luis Obispo		South County	
	2010	2013	2010	2013	2010	2013	2010	2013
Housing that I Like and Can Afford Closer to a School or Park	26.4%	14.5%	22.2%	13.1%	21.3%	12.5%	40.3%	22.1%
A Park or Playground Located Closer to My Existing Home	31.9%	33.6%	44.8%	43.8%	31.2%	15.0%	55.4%	21.0%

Source: ACTION for Healthy Communities, Telephone Survey, 2010 and 2013.

Note: This was a multiple response question which enabled respondents to select more than one response.

The most common way to get to school was by car, followed by taking the school bus. About a quarter of elementary school children in the North Coast and San Luis Obispo regions walk to school, and 13% of those in the North Coast region bike. In the South County region, 12% walk to school and 3% bike.

Walking was even more prevalent in the North Coast region for Middle or Junior High School children at 38.1%. The percentage for South County respondents was higher as well at 18.7% walking to school.

When asked specifically about what would encourage active transportation to school, the largest numbers of responses were living closer to school, sidewalk or street improvements, and crossing guards.

Table 12 Responses to “which of the following would encourage your children to walk or bike to school more frequently?”

Response	2010	2013
Living Closer to School	65.2%	56.0%
Sidewalk or Street Improvements For Safety	43.8%	28.7%
Traffic Crossing Guards on Duty	24.9%	20.1%
Slower Traffic Speeds on Streets	23.8%	16.3%
Increased Feeling of Safety From Crime	26.7%	14.1%
Change In Attitude, So That It's a Cool Thing to Do	26.4%	14.1%
Other	6.2%	20.6%

Note: This was a multiple response question which enabled respondents to select more than one response.

In both years, more respondents chose “living closer to school” in the South County Region than the North Coast. In 2013, more South County respondents selected “crossing guards on duty,” and “increased feeling of safety from crime.”

The California Highway Patrol maintains the Statewide Integrated Traffic Records System, which collect and process data gathered from a collision scene. Though the online records database does not maintain totals for Cayucos alone, totals for this area only were accessible via records request. The total number of injury and fatal collisions, total number of pedestrian-vehicle collisions, injuries, and deaths, and total number of bicyclist-vehicle collisions, injuries, and deaths all for the previous 10 years were requested. According to the results, there were nine pedestrian-vehicle collisions resulting in injuries since 2004, and two of these collisions resulted in death. There were eight bicycle/vehicles collisions since 2004, and of these seven resulted in injuries (CHP, 2014).

The Physical Fitness Test, or FITNESSGRAM, for students in California schools, uses criterion-referenced standards to evaluate fitness performance. There are tests for aerobic capacity, body composition, strength, and flexibility. In 2011, aerobic capacity and body composition fitness areas were classified into three general areas: “in the healthy fitness zone (HFZ), “needs improvement,” and “needs improvement-high risk.” Performance for the other four fitness areas as well as previous years 2006–1999 is classified into two general areas: “HFZ” and “needs improvement.” The standards were established to represent a level of fitness that offers some degree of protection against diseases that result from sedentary living.

Of 18 5th Graders tested at Cayucos Elementary during the 2012-2013 school years, 17% were classified in the “needs improvement health risk” category for body

composition. In the aerobic capacity area, 39% were classified as “needs improvement”. According to the California Department of Education, aerobic capacity is perhaps the most important indicator of physical fitness and assesses the capacity of the cardiorespiratory system by measuring endurance. Of 34 Cayucos 7th Graders, 21% were classified in the “needs improvement health risk” category for body composition, and 6% were classified as “needs improvement” under aerobic capacity.

**Table 14 Cayucos Elementary District, 2012-13 California Physical Fitness Report

For students at Lucia Mar Elementary, the school that Oceano children attend, 29% of 5th graders and 31% of 7th Graders were classified in the “needs improvement health risk” category for body composition during the 2012-2013 school year. In the aerobic capacity area, 19% of 5th Graders were classified as “needs improvement” and 9% were classified as “needs improvement health risk”. In that same category, 15% of 7th Graders fell under the “needs improvement health risk” category. Students in the 9th Grade were also tested for fitness. Of 863 9th Graders, 21% were classified in the “needs improvement health risk” category for body composition and 11% for aerobic capacity.

California Department of Education. (2013). *Physical Fitness Testing (PFT)*. Accessed April 29, 2014 at: <http://www.cde.ca.gov/ta/tg/pf/>

San Luis Obispo Council of Governments released Safe Routes to School data which provided 2013-2014 PFT results. Students in grades 5-7, from 29 schools, of five different school districts across the county were tested. 64 Oceano Elementary 5th graders participated in the test.

Table 16 Oceano Elementary, 2012-13 California Physical Fitness Report Summary of Results

Oceano Elementary 5th Graders					
	Total Tested	Number in HFZ	% Students in HFZ	% Needs Improvement	% Needs Improvement - Health Risk
Aerobic Capacity	64	43	67.2	18.8	14.0
Body Composition	64	31	48.4	17.2	34.4
Abdominal Strength	64	60	93.8	6.2	N/A
Trunk Extension Strength	64	37	57.8	42.2	N/A
Upper Body Strength	64	27	42.2	57.8	N/A
Flexibility	64	53	82.8	17.2	N/A

California Department of Education. (2013). *Physical Fitness Testing (PFT)*. Accessed May 30, 2014 at: <http://www.cde.ca.gov/ta/tg/pf/>

Only 48.8 percent of students tested in the HFZ; the lowest figure of all the tested schools in San Luis Obispo County. Further, 34.4 percent of the students scored in the *Needs Improvement (NI) – Health Risk* zone; the highest percentage in the county. “NI – Health Risk indicates that if the student continues to track at this level there is a clear *potential* for future health problem (a *more probable* risk)” (Human Kinetics, n.d.).

Inferences may be drawn from these results as the percentage (29 percent) of time spent (less than 10 hours per week) by South County children on screen time (computer, television, videos, texting) has increased from 2010 levels (Action, 2013, p. 109), which may indicate children in Oceano are spending less time doing physical activities in favor of sedentary behaviors.

MENTAL HEALTH AND WELLBEING

Those reporting their mental health as good, very good, or excellent decreased, while the number of mental health patients and the unmet need for mental health care increased (ACTION, 2013).

Incidence of suicide also increased. The number of 2-1-1 calls for assistance, a free program for health and human services information and referrals, increased from 3,376 to 5,196 in 2011. The highest numbers of calls were for mental health and addiction assistance, which increased from 347 calls to 854 total calls (ACTION, 2013).

HOUSING NEEDS

The County of San Luis Obispo was given a Regional Housing Needs Assessment (RHNA) Allocation of 4,090. SLOCOG recognizes the importance of creating more housing opportunities for the lower end of the income earning spectrum, and seeks to increase the housing supply and the mix of housing types, tenure and affordability within the region in an equitable manner. For the Unincorporated regions of County of San Luis Obispo, including Cayucos and Oceano, the RHNA is allocated 1,347. Because the Unincorporated Region makes up 43.8% of the County of San Luis Obispo's population, these units are meant to accommodate 151,519 people.

Housing is generally considered affordable if total housing costs do not exceed 30% of household income. The categories of affordable housing are: extremely low, very low, low and moderate. From 1980-2008, in the County of San Luis Obispo Coastal Zone (Cayucos, Cambria, Los Osos and Avila Beach) 569 housing units were built and received final inspections yet only 3 units for low and very-low income and 7 moderate income units were built in the Coastal Zone, in Cambria and Avila Beach respectively. No affordable housing units were built in Cayucos. The County's 2009 Housing Element presents no vacant or underutilized high density sites for very low and low income housing in Cayucos. The Estero Plan supports increasing opportunities for affordable housing by allowing limited residential development in office and commercial areas (Estero Area Plan, 2009).

SUBSTANCE USE

Alcohol use increased since 2006, but self-reported student substance abuse declined. Over three-quarters of those surveyed in 2013 were concerned about drug, tobacco, and alcohol abuse in their community. The percentage has remained about the same since 2006. The percentage of residents that were very concerned was higher in the South County compared to the North Coast, but the North Coast respondents selected somewhat concerned at a higher percentage (ACTION, 2013).

Table 17 “How concerned are you about drug, tobacco, and alcohol abuse in your community?” Response by region:

Response	North Coast		North County		San Luis Obispo		South County	
	2010	2013	2010	2013	2010	2013	2010	2013
Very Concerned	32.9%	29.2%	40.3%	41.2%	40.0%	26.6%	37.2%	38.4%

Binge drinking rates were higher in the county than in the state as a whole, with 39% of residents over 21 years of age reporting that they drank 4 or 5 or more alcoholic beverages on an occasion in the past 30 days (ACTION, 2013). In San Luis Obispo County, 36% of pregnant women reported drinking at least once in the last month. Binge drinking was more prevalent among respondents in the North Coast region than in the South County, and the South county had the largest percentage of “none” responses for 2013 (ACTION, 2013).

Table 18 “Considering all types of alcoholic beverages, in the past 30 days, about how many times did you have (4 if female; 5 if male) or more drinks on an occasion?” Response by region:

SUBSTANCE USE AMONG CHILDREN AND YOUTH

The California Healthy Kids Survey is conducted to provide data that would assist schools in (1) preventing youth health-risk behaviors and other barriers to academic achievement; (2) promoting positive youth development, resilience, and well-being; and (3) fostering positive school climates and engagement in learning. It consists of core questions as well as questions incorporated by the subject school, with the primary focus being assessment of student perceptions and experiences, including health-related, non-academic learning barriers (e.g., substance use, bullying and violence, and poor physical and mental health) (CHKS, 2011).

Of those respondents ACTION respondents with middle school aged children, 56% reported that alcohol and drug abuse problems were a very serious or somewhat serious problem in 2013, up from 45% in 2006 and 48% in 2010 (ACTION, 2013). According to the 2011-12 California Healthy Kids Survey, the number of 11th graders that had consumed at least one drink of alcohol in the past month decreased from 43% in 2003-2004 to 38%. Use of marijuana remained about the same over the same span of years (CHKS, 2011).

Youth tobacco use declined overall from 20% in 2005-2006 to 13% in 2011-2012, but the prevalence of smoking among youth in the county was occurring at a higher rate than the state of California as a whole. Tobacco use declined, and more people that smoke reported attempting to quit (a 7% increase from 2006). The percentage of respondents who smoke were higher in the North Coast region, and the percentage decreased by more from 2010 to 2013 in the South County region than in the North Coast region (ACTION, 2013, CHKS, 2011).

In comparison to California State percentages, use of tobacco was reported to be lower at Cayucos Elementary. Zero percent of Cayucos 7th Grade students had ever tried smokeless tobacco or cigarettes. However, a higher percentage of Cayucos students reported drinking alcohol, smoking marijuana, and using inhalants (ACTION, 2013, CHKS, 2011).

Lucia Mar Unified Secondary. California Healthy Kids Survey, 2009-10: Main Report San Francisco: WestEd Health and Human Development Program for the California Department of Education

FOOD ACCESS AND EATING HABITS

The percentage of respondents that exercise moderately and eat the daily recommended amount of fruits and vegetables increased, while obesity rates declined from 60% to 48.1%. The ACTION report indicates that the percentage of children in the county living below the federal poverty level and the number enrolled in the free and reduced school meal program both increased. The percentage of residents who were able to afford enough food, however, increased. The current nutritional guidelines made by the Department of Agriculture recommend getting a minimum of five servings of fruits and vegetables per day. According to the 2013 survey, only 46% of teens and 48% of adults in the County meet this standard (ACTION, 2013).

Table 23 “Yes” response for respondent’s self, when asked “On average, do you eat 5 or more servings of fruits and vegetables every day?” by region:

2010 n: North Coast=255, North County=309, San Luis Obispo=235, South County=285; 2013 n: North Coast=251, North County=291, San Luis Obispo=294, South County=259

Table 25 “Yes” response for respondent’s teenagers:

2010 n: North Coast=36, North County=57, San Luis Obispo=40, South County=51; 2013 n: North Coast=29, North County=63, San Luis Obispo=30, South County=41

Source: ACTION for Healthy Communities, Telephone Survey, 2010 and 2013.

When asked how many glasses or cans of soda or other sugar sweetened beverages they drink in a day, 73% responded zero, 13.9% responded 1, and 6.2% responded three. Percentages were higher for children 11 and younger, with 16% reporting that their child drank one sugar-sweetened beverage, and 9.4% drank two. The percentages of people who drank one or more sugar-sweetened beverages were higher for the South County region and lower in the North Coast region.

Table 26 Response to “Yesterday, how many glasses or cans of soda, such as Coke, or other sweetened drinks, such as fruit punch or sport drinks, did you drink?”:

Response	Overall	North Coast	North County	San Luis Obispo	South County
Zero	69.3%	76.4%	66.9%	80.2%	63.0%
1	15.9%	10.5%	21.1%	14.3%	12.1%

ENVIRONMENTAL QUALITY CONCERNS

In 2013, respondents were most concerned about water quality (69%), air pollution (59%), traffic congestion (58%), building in open space (57%), and pesticide use near homes (56%) (ACTION, 2013). These concerns have been reported as top concerns since 2006. A higher percentage of South County respondents reported concern about air pollution, traffic congestion, and pesticide use than those in the North Coast region. North Coast respondents had the highest response rate for concern over building in open space.

**Table 28 “How concerned are you about the following issues in your community?”
Response by region:**

Response	North Coast		North County		San Luis Obispo		South County	
	2010	2013	2010	2013	2010	2013	2010	2013
Water Quality	87.7%	74.1%	76.0%	68.4%	68.5%	61.4%	80.2%	72.3%
Building in Open space	73.4%	63.0%	62.3%	55.1%	69.5%	58.6%	64.9%	56.1%
Pesticide use Near Homes	66.6%	55.8%	53.3%	50.5%	54.9%	52.0%	59.9%	64.1%
Air Pollution	56.0%	53.9%	65.1%	60.4%	62.5%	53.0%	64.1%	64.1%
Traffic Congestion	50.7%	39.3%	63.5%	59.3%	70.4%	58.8%	68.2%	65.8%
Total respondents	250-259	244-250	307-311	287-294	237-244	288-294	276-286	258-262

Source: ACTION for Healthy Communities, Telephone Survey, 2010 and 2013.

The vast majority of survey respondents visited their nearest park, trail, or beach at least once in the last three months. However, 27% reported that they do not live within walking distance to a park, playground, or open space (CHIS, 2011-2012). Overall, residents would like to see more hiking trails, bike paths, natural areas, and parks in the county.

Table 29 Response to, “What new recreation opportunities would you like to see in your community?”

Response	2010	2013
Hiking trails	53.6%	54.5%
Bike paths	56.6%	52.5%
Natural areas	51.4%	47.3%
Parks	46.8%	45.0%
Senior centers	41.8%	36.7%
Playgrounds	39.9%	34.3%
Sports fields	29.9%	28.9%
Gyms	19.2%	20.1%
No new recreation opportunities needed	7.9%	8.0%
Swimming pools	2.1%	1.4%
Other	11.1%	10.3%
Total Respondents	1,087	1,078
Total Responses	3,894	3,655

Note: This was a multiple response question which enabled respondents to select more than one response.

Note: For additional information on regional breakdowns, please see Appendix D.

Long commutes and too much traffic increase stress and affect overall health, as well as contribute to air pollution. Caltrans traffic data shows that 55% of San Luis Obispo County residents who commute travel less than 20 minutes to work, and 5% commute over an hour (ACTION, 2013). The increase in vehicle miles traveled (VMT) has outpaced population growth by a 3 to 1 ratio, although this increase has slowed since 2009.

Table 30 Comparison of Increases in Population, number of vehicles, and Vehicle Miles Traveled (VMT), in San Luis Obispo County

Population Source: California Department of Finance, Demographic Research Unit

Vehicle Population and VMT Source: California Air Resources Board's EMFAC 2011-SG database

Note: 2005 was used as a baseline for calculating the cumulative percentage increase. In 2005, the population was 257,567, the vehicle population was 186,364, and the VMT was 6,494,086.

The San Luis Obispo Air Pollution Control Board (APCD) monitors particulate matter and ozone in the air. Long-term exposure to high concentrations of particulate matter and high ozone levels (smog) pose a health danger for the effects to lung and heart problems. Particulate matter is measured at two levels, 2.5 microns or less in diameter (PM_{2.5}) and 10 microns or less (PM₁₀). These size particles can penetrate the lungs and cause harm. There were an estimated 3.1 days in 2012 when the PM_{2.5} exceeded the national standard, up from 0 days in 2006 (ACTION, 2013). PM₁₀ and PM_{2.5} levels continue to frequently exceed health standards in the South County with no evidence of improvement. District studies show dust from the Oceano Dunes State Vehicular Recreation Area to be the primary emissions source contributing to this problem (APCD, 2012). The South County Community Monitoring Project was employed to see how much the different neighborhoods in Oceano and on the Nipomo Mesa were affected by

the dust that blows off the Oceano Dunes. Data gathered from the Oceano area showed elevated particulate concentrations are present during high northwesterly winds at monitors in close proximity to any area of disturbed open sand. These sand areas include the beach as well as Pier Avenue where sand commonly is tracked out of the SVRA by vehicles exiting the park. The project data showed the extent of the plume from these open sand areas to be quite small, with particulate concentrations diminishing quickly downwind. A 40% drop in PM10 concentration was observed just 0.1 mile downwind of the Pier Avenue monitoring site, while almost no plume presence was detectable at a site less than 0.4 miles downwind from the beach area (APCD, 2013)

In 2012, zero days exceeded the California ozone standards, down from 5 days in 2006.). Monitoring sites throughout the county show that certain areas reach non-attainment levels more often than others. Ozone levels are highest in the Carrizo Plains and Gillis Canyon Road. Coastal areas have always enjoyed relatively low ozone levels, with state or federal standards only rarely exceeded. While there is no evidence of improvement beyond these already low levels, there is no evidence of deterioration, either (APCD, 2012).

According a survey of 5th grade students at Lucia Mar Elementary, 24% of students responded that a parent or other adult told them they have asthma, and 17% reported having trouble breathing when not exercising (CHKS, 2011).

The majority of survey respondents reported being “very or somewhat concerned” about water quality. The Beach Report Card measures water quality at 19 different locations on beaches throughout the county. The grades vary from year to year, ranging from 79% of days receiving a grade C or better in 2010-2011 during wet weather, to 100% of days in dry weather in 2011-2012.

Table 31 Beach Quality, percentage of Days Receiving “C” or Better

Beach Type	2009-2010	2010-2011	2011-2012
Summer Dry	100%	95%	100%
Winter Dry	95%	94%	100%
Wet Weather	90%	79%	95%

Source: Beach Report Card, Heal the Bay 2009-2012

Note: Grades refer to the possibility of getting sick from contaminants from swimming at the beach for 1 day. The higher the grade, the lower the chance of getting sick. Beach quality was measured at 19 different locations around San Luis Obispo County.

Water supply continues to be a challenge in the Central Coast region, from securing adequate and reliable sources of water to overuse in agricultural areas. In Cayucos, per connection water use has decreased by 41% since 2005. In Oceano, use has increased by 2.2%.

PUBLIC SAFETY

Almost 80% of survey respondents in 2013 reported feeling “very Safe” in their communities, 21% reported feeling “Somewhat Safe” and 0.8% reported feeling “Not at all Safe.” In the North Coast region, the percentage responding “Very Safe” declined slightly to 86.8% from 2010 (90%). In the South County, this percentage increased from 73.3% to 76.2% from 2010 to 2013.

Table 32 “How safe would you say you feel in your neighborhood?” response by region.

2010 n: North Coast=259, North County=311, San Luis Obispo=244, South County=286; 2013 n: North Coast=251, North County=295, San Luis Obispo=294, South County=262

Source: ACTION for Healthy Communities, Telephone Survey, 2010 and 2013.

Respondents listed child abuse (77%), crime (73%) and teen violence (66%) as top public safety concerns in 2013. Domestic violence calls and total cases of substantiated child abuse decreased from 2006 to 2012. However, the rate of child abuse cases for the county was higher (13.9 per 1,000) than California as a whole at 9.2 per 1,000.

Response percentages declined for all answer choices in all regions from 2010.

According to the California Department of Justice, total crime rates declined from 28.9 per 1,000 residents in 2006 to 26.7 per 1000 residents in 2012. Incidents of rape and robbery declined, while aggravated assault increased by 34.9%. Juvenile crime, one of the most salient indicators of community safety, as it is associated with abuse, neglect, substance abuse, mental health problems, gang activity, and family disorganization also decreased in 2012 (Noguera, P., 1995). The juvenile felony and misdemeanor arrest rates decreased from 2006 to 2012.

In Cayucos, when given the statement “I feel safe at my school”, 86% of 7th Graders chose either “Agree” or “Strongly agree”, and 14% chose “Neither agree nor disagree.” Fifth graders responded “Yes, all of the time” at 55%, “Yes, most of the time” at 27%. In comparison to California State percentages, Cayucos 7th grade students reported a higher incidence of harassment at school, but fewer fights and a lower percentage of fear of being beaten up.

Table 33 Cayucos Selected School Safety Related Indicators with Comparisons to 2007 State CCS

	7th Grade %	
	District	CCS
School Safety		
<i>During the past 12 months at school, have you....</i>		
been harassed because of race/ethnicity, religion, gender, sexual orientation, or disability?	50	31
been in a physical fight?	10	32
been afraid of being beaten up?	9	29
During the past 12 months on school property, did you carry any weapon (gun, knife, or club)?	18	10
How safe do you feel when you are at school? Very safe.	32	18
Do you consider yourself a member of a gang?	14	9
School Protective Factors - High Levels (Resilience Indicators)		
Caring relationships with teacher or other adult	64	31
High expectations from teacher or other adult	68	45
Opportunities for meaningful participation at their school	18	16
Total	55	31
School Connectedness Scale	55	39

In Oceano, 7th, 9th, and 11th Grade students were surveyed. When given the statement “I feel safe at my school”, 73% of 7th Graders chose either “Agree” or “Strongly agree”, and 18% chose “neither agree nor disagree.” When asked how safe they feel at school, 29% of 7th graders answered “very safe” as opposed to 18% in the state as a whole.

*The California Student Survey includes 9th and 11th graders in Continuation/Alternative schools with the data from Comprehensive/Traditional high school students.

According to the ACTION for Healthy Communities survey, the top concern reported by survey respondents in 2013 was the expanding population (14.6%). This was the top concern for both the North Coast region and the South County. Also in the top three were concerns about employment and water.

Table 35 Response to “In your opinion, what do you think is the one most important issue facing San Luis Obispo County in the next few years?”

2006	2010	2013
1. Growing too Fast/Uncontrolled Growth/Overpopulation (41.6%)	1. Employment/Jobs (21.8%)	1. Growing too Fast/Uncontrolled Growth/Overpopulation (14.6%)
2. Housing Costs/Cost of Living (19.9%)	2. Growing too Fast/Uncontrolled Growth/Overpopulation (13.4%)	2. Water (14.3%)
3. Traffic (11.5%)	3. Water (11.9%)	3. Employment/Jobs (11.1%)

Total Respondents = 427	Total Respondents = 921	Total Respondents = 936

Source: ACTION for Healthy Communities, Telephone Survey, 2006, 2010 and 2013.

Note: This was an open-ended survey question which allowed the respondent to provide any answer. Due to variance in coding, data should be compared by top responses rather than tracking individual responses over time.

Existing County Plans Analysis

To understand the needs for change that better support community health, it is important to first look at what is included in existing policy documents. Cayucos and Oceano are unincorporated areas in San Luis Obispo County and therefore fall under County jurisdiction.

Many of the components of the County General Plan address components of health, even without the inclusion of a health element or health chapter. A 2012 American Planning Association study was used as the basis for the analysis of existing documents (Ricklin, 2012). The study surveyed planners across the nation to find out about the extent to which their current planning documents addressed health. Twenty-two plans were evaluated to determine the extent to which they address public health. Topics included active living, emergency preparedness, environmental exposure, food and nutrition, health and human services, social cohesion, and mental health. The use of this checklist provided a more comprehensive analysis of what is already included in and what is missing from the documents that govern the Cayucos and Oceano communities.

COUNTY AREA PLANS

County area plans describe specific land use policies and categories that determine uses, density, and intensity for the specific portions of the county. They specify development standards for public services, circulation, and land use, as well as programs for correcting local problems or conditions.

ESTERO AREA PLAN

The Estero Plan was adopted in January 2009 to establish a vision for the future of the Estero Planning Area that will guide development over the next 20 years. The goals encourage carefully planned development that respects the area's natural assets, maintains the community's small-town character as a beach community, and balances and promotes both the residential and visitor-serving aspects of the community.

The Estero Area Plan outlines a low-growth, slightly urbanized vision for Cayucos that keeps with its current character, but may also serve to encourage healthy design. The Estero Area Plan outlines the vision for future land use in Cayucos, which includes preventing urban sprawl, encouraging infill development, the creation of a greenbelt surround the town, allowing limited residential development in commercial areas, and phasing development in accordance with available water supply (Estero Area Plan, 2009).

The Estero Area Plan, like the Land Use framework document, includes a goal to foster health and wellbeing, though it does not identify the built environment as a factor in public health or mention chronic disease or health inequity in the vision or introduction. Though the plan is written in clear, non-technical language that makes it accessible to the layperson, matters of public health are not generally identified in this way. Images

and maps do not identify or consider vulnerable populations or differences in geographies or identify procedure for evaluating or monitoring the health impacts of plans.

Though the plan includes goals and policies that support public health, generally there is no mention of how these may contribute to public health. For example, the plan includes statements of support or policies to maintain and increase public access to the shoreline and recreational opportunities, but does not include a goal to increase active transportation or the number of people who walk and bike to daily activities. There is also no mention of the mental health benefits of natural spaces. The plan does identify programs to improve pedestrian access and safety and to provide traffic calming (PG 4-29), establishes guidelines for including sidewalks and bike lanes in future development, and establishes a high level of service for park access and design (pg 4-33, 4-34).

The Estero Plan includes policies to protect ground and surface water, including for stormwater runoff, though it is lacking in other areas of environmental exposure protection. Health and human services goals and policies are largely absent from the plan. There are policies included to limit noise to sensitive receptors and incorporate design features to increase safety, though there is no mention of the impact that this may have on crime prevention or promoting active lifestyles.

As in the APA study, the Estero plan is strongest on goals and policies relating to active living, although the explicit link to public health benefit is missing. Environmental exposure is also more strongly represented, although the focus is likely attributable to the influence of CEQA policies. These considerations are helpful to protecting health, but again lack the crucial connection between environmental quality, exposure, and community health. The Estero Plan is very weak in the areas of food and nutrition,

emergency preparedness, health and human services, and social cohesion and mental health. Some of these topics, however, are better suited to other elements of the County General Plan.

SAN LUIS BAY COASTAL AREA PLAN

Oceano, along with Pismo Beach, Grover City, Arroyo Grande, Halcyon, and the urban area of Avila Beach, comprise the San Luis Bay Planning Area. The Plan (last revised in August 2009) describes the land use policies for the Coastal Zone portion of the San Luis Bay Planning Area, as well as defines allowable density and intensity and specific development standards meant for addressing issues unique to the individual communities.

The Plan does not contain any explicit promotion of public health related goals or policies in reference to Oceano. In fact, the term “health” is never used in the document within the context of providing benefits for, or the protection of, public health purposes. However, some of the language used throughout the document does have public health supporting implications.

The San Luis Obispo County’s General Plan provides recommendations for programs or policies found in the San Luis Bay Coastal Area Plan that have potential public health ramifications. Specifically, one of the Oceano Urban Area Program recommendations is for the County Engineering Department to work in conjunction with property owners and LAFCo in an effort to bring urban street improvements such as curbs, sidewalks and street trees, to residential areas (Ch. 6, p 19). These improvements could provide increased pedestrian mobility and enhance the aesthetic appearance within the neighborhood, which can both act as catalysts for provoking physical activity.

The Land Use section does provide this potential public health impacting recommendation “a neighborhood park site should be reserved in the easterly portion of the community to better meet resident needs” (Ch. 6, p.14). Though, the recommendation makes no connection between parks or green spaces and the benefits to public and mental health. In Chapter 4: Circulation (2009), the Plan states “the planning area will likely continue to be automobile-based, but alternative components of the circulation system such as transit, bikeways and air traffic will be important components of the area wide circulation system.” Recommendations for improved bikeways, “Bike lanes as wide 8 feet, or separated Class I bikeways, are needed on such roadways as [...] along Highway 1 from Pismo Beach through Oceano [...] Class II or III bikeways are recommended on Highway 1 from Oceano onto the Nipomo Mesa” (Ch.4, p.2) are mentioned for future improvement projects. The potential health and environmental benefits of increasing bike ridership is not mentioned.

OCEANO SPECIFIC PLAN

The Oceano Specific Plan (2001) was adopted by the San Luis Obispo County Board of Supervisors in 2002, and certified by the California Coastal Commission in 2004. The Specific Plan’s purpose is to provide “an overall framework for translating broad community values and expectations into specific strategies for enhancing the community’s quality of life” (County of San Luis Obispo, 2001, p. 1). The concerns addressed in the Specific Plan were informed by Oceano residents through information collected via surveys, meetings and public workshops. The Specific Plan is meant to be used in conjunction with the San Luis Bay Area Plan.

The Specific Plan places an emphasis on safety, sidewalks, bicycle infrastructure, park, open spaces and recreational facilities, as demonstrated by one of the Specific Plan’s

four defined primary goals, Oceano's future community designs will feature "Improved buildings, public spaces, pedestrian walkways, safe bikeways, more natural areas, parks and high quality landscaping" (p. 13). Indeed, the concept plan for Oceano's downtown is a pedestrian oriented, mixed-use commercial retail development. As detailed in the literature review section of this report, the provision of these built environment features are associated with inhibiting physical activity behaviors, and therefore may yield potential health benefits. There is also implicit acknowledgment that parks, public open spaces and plazas provide intangible beneficiary value by fostering social activity, interaction and community cohesiveness (p. 16), all of which research has shown to be associated with improved mental well-being.

While many of the goals, programs, land use regulations, development standards and design guidelines stated in the Specific Plan would have corresponding positive health impacts, it is generally not described in the document as the overriding motive. Rather, the outlined development strategies are meant to be "used as a promotional tool, to acquaint potential developers with Oceano's economic potential and the expectations of its residents" (p.1). Nevertheless, from a health perspective, the plan does provide new development standards and programs that will serve to help Oceano residents.

OCEANO REVITALIZATION PLAN

The County of San Luis Obispo, in partnership with the Local Government Commission from the California Department of Transportation, funded by an Environmental Justice Planning Grant, created the Oceano Revitalization Plan (ORP), with work beginning in 2012. The Plan builds off of the 2002 Oceano Specific Plan and seeks to employ actions that will implement policies outlined in the Specific Plan. The ORP lists three objectives:

- Identifying improvements that will lead to a safer and more walkable downtown and adjacent neighborhood areas,
- Planning for improved mobility, and
- Creating more attractive streetscapes along Highway 1 to enhanced retail activity and jobs

Whereas the Oceano Specific Plan sees improvement of sidewalk infrastructure and connectivity as a necessary step to encourage new development in Oceano, the ORP makes a clearer connection between the health benefits of providing such amenities. For example, “Frequent bicycle racks along the street corridor are another necessity for promoting healthy community living and easily enabling alternative modes of transportation” (County of San Luis Obispo, 2013, p. 47).

Public safety is also a primary concern of the plan, as both short- (crosswalk striping, bike lane restriping) and long-term (street medians, roundabouts, lane reductions) improvements, are focused on pedestrian, bicyclist and motorist safety. Improvements in traffic safety and connectivity remove fear barriers and increase opportunities to be physical active.

LOCAL COASTAL PROGRAM

According to the California Coast Act of 1976, local governments must prepare a land use plan and schedule of implementing actions to carry out the policies of the Coastal Act in all areas designated as a coastal zone. The California Coastal Commission is a state agency with quasi-judicial regulatory oversight over land use and public access in the California coastal zone. San Luis Obispo County consists of an expansive coastal zone which encompasses Cayucos’ entire boundary [and part of Oceano].

The Coastal Zone Land Use Ordinance (CZLU) is the guiding document of allowable uses in designated coast zones. The purpose of this document is to implement the General Plan and the Coastal Program, and to guide and manage future growth of the county in accordance with those plans. Further, to minimize adverse effects on the public resulting from inappropriate creating, location, use, or design of building sites, buildings, land uses, parking areas, or other forms of land development by providing appropriate standards for development,.

OTHER COUNTY GENERAL PLAN ELEMENTS

Other goals and policies that apply in Oceano and Cayucos are described in the County General Plan. The General Plan is the blueprint for the future physical, economic and social development of the unincorporated areas of the county, outside cities. It implements California laws that regulate land use planning and development. State law requires that every general plan must contain the following components or "elements": Land Use, Conservation, Noise, Circulation, Open Space, Safety and Housing. In addition, state law allows for the adoption of additional or optional elements of a general plan. The County of San Luis Obispo has adopted seven optional elements: Recreation, Historic and Esthetic, Energy, Off-shore Energy, Economic and Agriculture.

Implications

Implications and challenges for Cayucos and Oceano have been identified from the research presented in the Existing Conditions Report. Below is a summary of the implications of this information and the challenges presented for each community. This information is incorporated into the design of the outreach phase of the project as well as the goals and programs recommended in the draft plans.

IMPLICATIONS FOR CAYUCOS

- Population growth has declined in Cayucos, and vacation homes and rental units account for many of the housing units.
- The population in Cayucos is trending toward older residents, and the median age is quite high at 57.2. This has implications for the prevention of injury, transportation modes, and well as medical care access.
- Cayucos is a bedroom community with very few options for active transportation or transit, which has implications for environmental health and physical activity levels.
- The population in Cayucos is mostly white, well-educated, and almost 100% English speaking, which will impact community outreach efforts.
- Transit to and from Cayucos is infrequent and time-consuming, which is likely deterring the use of the bus system and increasing the dependence on personal vehicles.
- Cancer and heart disease are the leading causes of death in Cayucos by a large margin. Though these chronic diseases are attributable to a number of factors, increasing exercise and healthy eating habits among community members may have a positive impact on these rates.
- Increased sports programs or after school activities were the number one choice for parents when asked what could increase physical activity for their children. This is important for determining collaborative actions in Cayucos.
- Though most Cayucos students are driven to school, when asked what would encourage active transportation to school, the largest numbers of responses

were living closer to school, sidewalk or street improvements, and crossing guards, all of which have to do with urban design and pedestrian safety.

- There have been several pedestrian and bicyclist deaths in Cayucos in the last ten years that were caused by collisions with automobiles. Pedestrian and bicycle safety should be a major priority in Cayucos.
- Cayucos Elementary students are in need of physical fitness improvements, and integrating physical activity and healthy eating habits into daily life may help to ameliorate these problems, and help to increase the chances of a healthy adulthood.
- Though the Estero Area Plan supports some aspects that affect community health, specific links between the built environment and health and several indicators are missing.
- North coast residents are very concerned with water quality and availability.
- Housing is not affordable for many income levels in Cayucos, although the low growth rate in town and high costs may render affordable housing infeasible.

IMPLICATIONS FOR OCEANO

- A large percentage of Oceano's population is comprised of Spanish-only speakers. Added considerations must be used when conducting outreach efforts; documents must be translated and Spanish speaking liaisons should be utilized during community interaction.
- Oceano is a young community, with just 20 percent of the population over the age of 40. This likely indicates a high percentage of young families with children.

Community goals should be mindful to include strategies that focus on improving health levels in children.

- A comparatively high percentage of Oceano residents carpool and walk to work. This could be due to the large migrant farm worker population walking to designated locations to carpool to nearby agricultural land. Emphasis should be placed on providing a complete sidewalk network for safe pedestrian travel.
- Cancer and heart disease are the leading causes of death in Cayucos by a large margin. Though these chronic diseases are attributable to a number of factors, increasing exercise and healthy eating habits among community members may have a positive impact on these rates.
- Both the Oceano Specific Plan and Revitalization Plan recognize the need for added park and recreation facilities on the eastern section of Oceano. However, neither plans identified potential areas to develop space for active recreation. Feasible and immediate strategies may be to develop a joint-use agreement to officially allow public access to Oceano Elementary recreation grounds after school hours.
- Oceano 5th graders had some of the poorest aerobic and body composition results in the entire county, as reflected in the 2012-2013 California Physical Fitness Report, putting them at high risk to incur future health problems. Ecological interventions, including those found in the built environment must be prioritized and included in development strategies.

IMPLICATIONS AND FOR BOTH COMMUNITIES

- Access to medical care is restricted by increases in cost, higher rates of health insurance, and proximity to medical facilities.
- Only about half of county residents participated in five or more days of physical activity for at least 30 minutes in 2013, and although this rate is slightly better than previous years, the lack of exercise among many county residents has great implications for health among those individuals.
- Mental health issues are increasing in the county, and there is potential for features in the built environment to contribute to overall mental wellbeing.
- Concern over alcohol and drug abuse remains at similar levels to previous years, although binge drinking rates and youth substance abuse have declined.
- Healthy eating is increasing in the north county, with obesity rates declining and more people consuming enough fruits and vegetables.
- County residents would like to see more hiking trails, bike paths, and natural areas in their communities.
- Most people feel safe in their neighborhoods, and total and juvenile crime rates decreased in the county

CAYUCOS FINDINGS

CAYUCOS FINDINGS

Introduction

This chapter contains the findings of the multifaceted study conducted in Cayucos to better understand the characteristics of the community, both in terms of the built environment and local knowledge. A physical inventory was conducted to achieve an understanding of the existing built environment in Cayucos, and ample community outreach provided local knowledge to augment this research.

The physical inventory included a walkability audit and food, parks, and hydration station access assessments. Results of these studies for Cayucos are summarized in this section and displayed in map form. Information is comprised of findings from the following efforts:

- Walkability Study
- Food Access Assessment
- Parks Access Assessment

Community outreach was conducted in several forms in an effort to gather valuable local knowledge and feedback from community members regarding physical activity levels, information about the built environment where they live, work, and play, and perceived barriers to healthful activities and food access. The efforts discussed below include:

- Presentations to Local Government Agencies
- Key Informant Interviews
- Community Group Meetings
- Cayucos Community Questionnaires

- Public Spaces Questionnaires
- Cayucos Farmers Market: Public Space Improvement Voting
- Cayucos School Outreach
- Plan Draft Review Event

Overall, findings indicate that Cayucos has many characteristics that help to support the health of individuals. However, there are several areas with room for improvement. The Key Findings section combines the most important, relevant, and frequently-encountered findings to present a summary that is useful for the creation of the draft Cayucos Community Health Plan. For more information on the methods for conducting the inventory and outreach, see the Methods section.

Physical Inventory

In order to better understand the built environment in Cayucos, a physical inventory was conducted to observe and measure features in a systematic way. Though photos of a town and even visits to the areas can speak volumes about the characteristics of that place, finding a way to measure spatial relationships can provide a different view and additional layer of understanding. The physical inventory included a walkability audit and food, parks, and hydration station access assessments. Results and key findings are displayed and described below for the following inventory efforts:

- Walkability Study
- Food Access Assessment
- Parks Access Assessment

Through these studies, it becomes clearer that some areas of Cayucos are better served by elements of the built environment that support health, such as comfortable pedestrian

travel and short routes to parks. A major finding also includes that there is very little access to healthy food in town. The analysis also could also allow the physical conditions in Cayucos to be compared to those in Oceano or other communities in the county.

WALKABILITY AUDIT RESULTS

A walkability audit was conducted in Cayucos to provide an objective evaluation of the walking environment, and to identify concerns for pedestrian related to safety, access, comfort, and convenience. Numerous features of the built environment have been associated with physical activity, including residential density, land-use mix, urban sprawl, intersection density, walkability, park availability, and accessibility to physical activity-related resources (Casagrande, 2011). To complete this analysis, an existing spatial analysis tool, the Pedestrian Environment Data Scan (PEDS) was utilized to quantify the qualitative aspects of the Cayucos walking environment, including sidewalks quality, traffic, land use patterns, building accessibility, safety, cleanliness, amenities, the degree of urban enclosure, among other factors. Due to time and resource constraints, the audit was targeted in the downtown area, mostly along Cayucos Drive and Ocean Avenue. Surround streets were not included in the study, although most of the residential areas connect to these major thoroughfares. This section presents the findings from the Walkability Audit study, complete with maps for visualizing problem areas and the most walkable areas of Cayucos by street segment. The detailed results for the audit are available in Appendix A: Physical Inventory.

The maps show that the overall pedestrian and bike-friendliness near the commercial core of the town. To draw more detailed conclusions about the walkability of the downtown area, the results were also divided into three categories: ease and comfort of travel, safety, and aesthetics. Each street segment was graded and assigned a color to

signify a low or high score. Green signifies the higher scores, yellow signifies scores at a slightly lower grade, orange signifies a low grade, and red signifies the lowest grades.

The overall walkability map (

Figure 3) shows the walkability measurement for each street segment through the downtown core. The top map shows the northwest side of Ocean Avenue, and the bottom map shows the southern end. To a frequent pedestrian or bicyclist visitor to the area, this map may present a finding that is very obvious. Segments 3, 7, and 8 are the most commercialized area of Cayucos, and generally have the most foot traffic. The sidewalks in this area are generally well-kept, and the overall walking and biking experience is pleasant and feels safe. There are many sidewalks, the buildings are accessible from the walkways, and the area is clean and in good condition. The ocean and beach provide a backdrop in this area that encourages visitors, and there are many shops and restaurants to visit. However, even in this area, bike parking is very limited, and sidewalks are sometimes quite narrow or have cracks or obstructions. Ocean Avenue is very wide with single lanes of up to 25 feet, angle parking on both sides of the street, and a center turn lane. The crosswalks are very long, and the view of pedestrians is somewhat obstructed by parked cars.

Figure 3 – Overall Walkability, Cayucos

Low ranking street segments (in red and orange) are concentrated at the edges of the commercial core and in areas with more residential uses. Segments 9, 10, and 11 ranked significantly lower in walkability overall compared to Segments 3, 7, and 8. This area comprises mostly hotels and residential uses, along with a large vacant area. Segment 9, in orange, connects with Pacific Avenue, the street that continues along the beachfront properties and to the beach access points. Segments along 13th Street, which connects Ocean Avenue and Pacific to the neighborhoods to the east of Highway 1, ranked low consistently.

Ease and Comfort of Travel

The ease and comfort of travel category (Figure 4) includes only certain categories from the PEDS assessment, including type and number of different uses, the slope of the terrain, sidewalk or walking path conditions, obstructions, and features, bus stops and bus stop amenities, and presence of wayfinding aids. The downtown core scored high in this category, but a few other segments also scored high enough to be shown in green for the presence of a bus stop, completed sidewalks, or fewer path obstructions. For instance, although segments 5 and 9 are very close to, or even considered to be part of the commercial core, they received low scores for ease and comfort of travel.

Figure 4 – Ease of Travel, Cayucos

Safety

The safety category (Figure 5) considers elements such as the number of lanes that a pedestrian must cross, sidewalk completeness, the type of pedestrian facility, number of high volume driveways, crossing aids, and lighting or signage. The safety of the streets therefore refers to safety from traffic, Crime Prevention Through Environmental Design (CPTED) elements, and elements that may increase the likelihood of injury. The segments in the commercial core that ranked highest in walkability overall ranked slightly lower (yellow) for the safety category largely for injury risk and traffic safety issues. The areas on the southern portion of Ocean Avenue maintain the consistent low scores. Cayucos Drive, however, ranked high in this category due in part to the number of crossing aids and other signage.

Figure 5 – Safety, Cayucos

Aesthetics

The last category attempts to measure the aesthetics of the study area through elements such as the presence of amenities like benches and water fountains, the presence of power lines or trees, cleanliness and maintenance, and degree of enclosure (Figure 6). Though the natural beauty of the town provides high aesthetic value to all areas, it is important to reiterate that the ranking system measures each street segments as compared to the other segments. The core commercial area ranked high in this category in part due to pedestrian amenities, building articulation, and the absence of visible power lines. The area near the Cayucos School on Cayucos Drive and the segment near the Cayucos Market and Paul Andrew Neighborhood Park also ranked high in this category (yellow). The southern end of Ocean Avenue was ranked lower.

Figure 6 – Aesthetics, Cayucos

The PEDS tool also includes a subjective assessment, in which the surveyor ranks the street segment on attractiveness for walking and cycling, and safety for walking and cycling. These results are not included because there is some question regarding the accuracy of the data collected. Spreadsheets used to compile and analyze this data are included in Appendix A: Physical Inventory.

Walk Audit Key Findings

- The overall most walkable street segments are in the core commercial area near the pier.
- Segments south of 8th Street along Ocean Avenue ranked consistently low overall and in the three categories, compared to other street segments.
- Segment 9 connects with Pacific Avenue and to the beach access points, but ranks low in overall walkability.
- Segments along 13th Street, which connects Ocean Avenue and Pacific to the neighborhoods to the east of Highway 1, ranked low consistently.
- Segments 9 and 12 (E Street to Pacific and 4th to 6th) ranked poorly in the Ease and Comfort of travel category, though the segments on either side of these segments ranked higher in that category.
- The segments in the commercial core that ranked highest in walkability overall ranked slightly lower (yellow) for the safety category, largely for injury risk and traffic safety issues.
- Cayucos Drive ranked high in the safety category due in part to the number of crossing aids and other signage.

- The street segments that offer the most in terms of aesthetics are in the core commercial area.

FOOD ACCESS ASSESSMENT

The food access assessment was included in the plan in order to analyze the existing availability of food outlets and to help determine need. The assessment was conducted using GIS data collected from San Luis Obispo County and by visits to each of the stores that sell food or beverages. For the analysis of the food retail environment, data was obtained from the local environmental health department to determine the location and type of stores that exist in the study area.

According to the Retail Food Environment Index (RFEI) standards, there are three unhealthy food outlets in Cayucos, and only one small market which sells alcohol but no tobacco (California Center for Public Health Advocacy, 2007). Most stores are similar to convenience markets or gas station shops and only sell alcohol, candy, chips, sodas, tobacco, and similar items. Figure 7 below shows a map that displays 1-mile and ½ mile distances along roads from these stores.

Figure 7 – Cayucos Store Locations

The only store in Cayucos that offers whole grain bread and tortillas, fruits and vegetables, low fat milk, or other healthy items is the Cayucos Supermarket, located on South Ocean Avenue. Figure 8 below shows a map that displays 1-mile and ½ mile distances along roads from the Cayucos Supermarket. Though the store is centrally located, a large portion of residential neighborhoods, especially to the south and across Highway 101 are not within the ½-mile or 1-mile walk or bike distance. This presents an issue of food accessibility and affordability for residents, especially those without access to a personal vehicle such as children and the elderly.

Figure 8 – Cayucos Healthy Food Access

Food Access Assessment Key Findings

- There are three unhealthy food outlets in Cayucos which sell only candy, chips, sodas, tobacco, and similar items.
- The only store with healthy items is the Cayucos Supermarket, located on South Ocean Avenue
- A large portion of residential neighborhoods, especially to the south and across Highway 1, are not within a ½-mile or 1-mile walk or bike to the grocery store.

PARKS ACCESS ASSESSMENT

The parks assessment was included to better inform the project as to the community's access to their nearby parks. The parks assessment was conducted using GIS data collected from San Luis Obispo County planning, and field reconnaissance. Both maps show ¼-mile and ½-mile access by way of existing streets. The assessment is meant to convey the accessibility of each facility or access point from the residential areas.

The first map shows parks only, without beach access points (Figure 9). Cayucos has three official parks: Hardie Community Park, Paul Andrew Neighborhood Park, and Norma Rose Park, as well as elementary school playgrounds at Cayucos Elementary School. Hardie Community Park is four acres and features playground equipment, picnic benches, horseshoes, and a lawn area. The tennis courts and community swimming pool are also located at Hardie Park. Paul Andrew Neighborhood Park is a 1-acre park with a playground, picnic tables, and a bike rack. The newest Park, Norma Rose Park, is a 1.5 acre park east of Highway 1. Planned improvements will include a skate park, children's playground, basketball court, rest-room, and picnic areas (San Luis Obispo County Parks, 2002).

According to National Recreation and Park Association (NRPA) recommended guidelines and the Estero Area Plan, Cayucos needs 27 additional acres of neighborhood and community parks. Cayucos is in particular need of facilities for "active" recreation or active parks, such as ball fields, children's play equipment, and recreation programs (Estero Area Plan, 2008). All of the parks in Cayucos are better suited to passive recreation. As shown in Figure 9, several residential areas are lacking in convenient access to community parks. Though parks are accessible by bike, many residents to the south of downtown do not have convenient pedestrian access to a park.

Figure 9 – Cayucos Public Park Access

Because many residents of and visitors to Cayucos use the beach for exercise such as walking, running, kayaking, or surfing, and because the beach serves as a community space, the second map identifies the beach access points. The NRPA park guidelines do not factor in access to the beach, which spans the length of the community, includes several access points, and provides a significant recreational opportunity. Though the beach is not an official park, a map was created to include distances along roads to beach access points along with parks Figure 10. With the inclusion of beach access, parks are accessible to most residences in Cayucos.

Figure 10 – Cayucos Park and Beach Access

Parks Access Assessment Key Findings

- Especially south of the commercial core, many residents do not have convenient pedestrian access to a park.
- Cayucos needs 27 additional acres of parks, especially active parks, although guidelines do not factor in access to the beach.
- With the inclusion of the several beach access points, parks are accessible by most residences in Cayucos.

Community Outreach

Background information was used to design and implement an outreach plan in order to create the most accurate, appropriate and relevant Community Health Plan. Community outreach was conducted in several forms in an effort to garner valuable local knowledge and feedback from community members regarding physical activity levels, information about the built environment where they live, work, and play, and perceived barriers to healthful activities and food access. Data is qualitative in nature and questions were developed with the intent of seeking local knowledge. These efforts included public meetings, meetings with key groups, key informant interviews, a community questionnaire, and planning events. The outreach results are described below under several categories:

- Presentations to Local Government Agencies
- Key Informant Interviews
- Community Group Meetings
- Cayucos Community Questionnaires
- Public Spaces Questionnaires

- Cayucos Farmers Market: Public Space Improvement Voting
- Cayucos School Outreach
- Plan Draft Review Event

The results of the outreach efforts and key findings are detailed below.

PRESENTATIONS TO LOCAL GOVERNMENT AGENCIES

The purpose presentations to local government agencies were to announce our presence in each community, to state what our intentions would be while working there, to provide the scope and details of our project and ask for their support, as well as to request information and field questions. This was determined to be an important initial step that was necessary prior to the start of any public outreach efforts.

The first presentation to the Cayucos community was December 4, 2013 at the Cayucos Citizens' Advisory Council (CCAC) regular meeting. The CCAC is volunteer organization advising the District 2 County Supervisor Bruce Gibson in matters affecting the community of Cayucos. Two elected representatives and one alternate represent each of the eight precincts. The presentation was a listed agenda item, and the purpose was to introduce the project to the community in a formal way, and to illicit feedback on which other community organizations or individuals to contact for meetings or interviews. The presentation gave a brief history of the relationship between public health and planning, the current chronic disease and obesity public health crisis that involves planning, and the general plan for conducting the project. The CCAC provided input on the idea of the project and some suggestions for outreach.

The second CCAC meeting occurred in June, 2014. The purpose of this presentation was to present the community with findings gathered and a draft of goals, key recommendations and policies for Cayucos. Feedback was welcomed, and important

changes were incorporated into the document. The presentation included some key findings from existing data and focused on results from community outreach, including the questionnaires, feedback from group discussions, and key informant interview themes.

Local Government Agencies Key Findings

The CCAC provided input on the idea of the project and some suggestions for outreach:

- Nearly 40% of the homes in Cayucos are rental units.
- Several community events were mentioned, including the Peddlers' Fair and the Sea Glass Festival.
- Citizens can be found at the Post Office, grocery store, banks, Senior Center, and the school.
- Cayucos is already a healthy place to live.

KEY INFORMANT INTERVIEWS

The following section discusses and analyzes the results of interviews with representatives from the community. Discussions centered on health issues, community priorities, assets and factors contributing to health, and barriers to improving health in the community. Key informants included government officials with extensive knowledge of Cayucos, active community members, and residents. The same questions were asked of each key informant, though conversations sometimes centered on related topics.

Questions and compiled answers are included below.

Question: *In your experience, or based on your work with the organization, what would you say are the top 3 or 4 most important assets or factors contributing to health in Cayucos?* All interview subjects listed the physical beauty as a factor contributing to

health, and some elaborated that this helped to get people outside. Many informants listed the sense of community as part of what makes the town a great place to live, specifically through the outcome of events like the Save the Pier concert event and the Fourth of July celebration. One interviewee described Cayucos as having "...a great year round climate, access to ocean sports, strong K – 8 school, community minded residents and independent thinkers and doers." Part of the sense of community comes from the involvement in clubs and organizations, though the majority of participants are older, retired residents. One interviewee lamented that she was involved in too many organizations and should learn to say "no", although this was part of what made the community special for her. However, there is also a sense of community at the bars and hangout spots, especially Hoppy's, Schooners, the Tavern, and the Wine Bar. There are a lot of young business owners that also contribute to the town, such as the owners of the Cayucos Hot Sauce company and the owners of Schooners. Young families have also found that Cayucos has a great elementary school, so great that some families want to move to Cayucos so that their children can attend Cayucos Elementary. One interviewee surmised that obesity is less of a problem in Cayucos than elsewhere in the county, and that the higher incomes of residents and gentrified environment may explain some of the reasons for healthfulness in Cayucos.

Question: *What would you say are the top 3 or 4 most important health issues in Cayucos?* The majority of key informants listed access to healthy, inexpensive food as a large issue, along with the aging population, restricted access to healthcare, and drug or alcohol abuse. Some listed housing affordability as a top concern, and mentioned that there are a lot of illegal or unpermitted secondary units or rentals in town. The lack of bike infrastructure, access to recreational/exercise equipment and facilities, and active transportation came up as issues as well. As one interviewee described, "Pedestrian safety is an issue on South Ocean and along Highway 1, since the community is sort of

divided by the highway. There are only a couple crosswalks and one underpass.” There was also mention of access being restricted to certain facilities, such as the pool, which is not open year-round. Interviewees expressed an interest in exercise classes that are age appropriate, either through a recreation program or a private gym. Alcohol use and abuse was brought up several times. One interviewee said that in Cayucos there is,

...Lots of drinking. People drive drunk a lot. I’m not sure about how many DUIs there are, but I’m guessing a lot...The stores in town are mostly selling liquor, and you will always see people in there buying wine, beer, or hard alcohol, sometimes what seems like a lot at a time.

One key informant also described a downside to the tight-knit community nature, especially for those that work and live in town.

Younger people are doing what they can to get by. They are like, ‘why move away and do something with your life?’ Some get priced out, but remain part of the community by coming to the bars even though they live in Cambria or Morro Bay.

Other problems mentioned included access to grant dollars for community health enhancements, the prevalence of smoking, and the effects of too much greenhouse gas emissions, which is contributing to climate change and will become more of an issue with sea-level rise.

Question: *Are the health issues you mentioned priorities for your organization, or are there any programs in your organization that are related to these issues?* Though most interviewees represented organizations not directly linked to health advocacy, a few programs and priorities were described. These included transportation for the elderly

and programs that encourage physical activity. Once interviewee mentioned that, “There are no local programs for drug and alcohol” in Cayucos.

Question: *How would you describe the overall health of the Cayucos community?* All informants spoke positively of the overall health in Cayucos. The most common answer to this question was that the beach and proximity to the ocean provided ample opportunities for active pursuits, and that the sense of community was helpful—presumably for mental health through social interaction. However, one informant described the overall health as “Positive, siloed and sometimes insular.” This relates to the general sense gathered from several conversations with residents, that identifying problems was sometimes difficult because the community was viewed so positively, and underlying that was an aversion to too much change, which might threaten the positive quality of life in Cayucos. Economic issues were also brought up here, including that there are not a lot of jobs, especially high-paying. The unfinished skate park and bicycle safety were brought up as issues relating to injuries. One informant listed mountain biking, surfing, and kayaking as specific reasons for good overall health, which also relates to the following question.

Question: *Would you consider Cayucos a physically active community?* This question brought about answers similar to the previous question, and many interviewees listed biking, walking on the beach, surfing, and hiking as evidence that the community is physically active. One informant put it thusly: “Cayucos is fairly active. Some people bike, and a lot walk on the beach in the mornings for exercise. People surf, even some of the older “salty dogs”—not just the younger people.” However, barriers to more physical activity were mentioned. The issues with an aging population were brought up, along with barriers to using active transportation, and some potential solutions.

The bus is really underutilized by most people, probably because it's not convenient...It seems like the only ones using it are Cuesta students...Better biking signs and lighting along the trail and Pacific could help people bike more, especially in the dark. The trail through the cemetery is totally dark, and I won't go that way on my bike alone at night...This might deter people from driving drunk after going to the bars.

Question: *Do you think that food is accessible, available, and affordable in the community?* Responses to this question were mixed. Some said that food is accessible, but not always affordable. Though there is only one grocery store in Cayucos, there are other options nearby in Cambria and Morro Bay. Some respondents described the prices at the Cayucos Market as "reasonable" while others characterized the prices as less affordable.

[Cayucos is] a vacation town, so things are a lot more expensive. I recently went to get chocolate chips for cookies, and they were \$5.00! Wine is about three times the price it is elsewhere, though beer is about the same price. People commute for work, so they mostly shop on their way home from work in Paso Robles or Morro Bay. In my neighborhood, there a lot of working class people. They go to the Cookie Crock Warehouse in Morro Bay, which has some very cheap, good produce. There is a farmers' market here, but it's held in the morning, I think on Fridays, so it's not really accessible to the working class.

Others had similar sentiments about the grocery store, and some mentioned that it is good "in a pinch" but does not carry all of the options necessary. Overall, food was not difficult to obtain for the interviewees, but it was not thought of as accessible in Cayucos.

Question: *Do you believe there are barriers to enacting policies and creating community support related to active living and healthy eating?* This question provoked similar answers from all the key informants regarding the character of the Cayucos community. As one respondent described, in Cayucos there is a “Libertarian point of view much of the time among people that are involved in politics and decision-making, and those that don’t have money don’t have time to be involved.” Another responded that “this is a participative community and not necessarily a “policy” community. We have raised nearly \$500K to restore the pier.” Others also mentioned other barriers, including that the potential red tape would make policy changes difficult, and one mentioned the difficulty created by the Coastal Commission regulations.

Question: *Do you know of any specific “champion” or “champions” for health in the community?* This question was meant to aid in further research, but no respondents were able to identify a “champion” for health. However, some respondents offered to help distribute the survey via email, or listed some community groups that should be contacted.

Question: *Do you think local government funds should be spent to support health policy actions?* Despite the barriers described in a previous question, the majority of interviewees answered “yes” to this question. Specific responses included, “Yes, funds allocated for health should be spent accordingly,” and “Yes, there should be acknowledgement of and investment in community health.”

Key Informant Interview Key Findings

- The beach and proximity to the ocean provided ample opportunities for active pursuits, including mountain biking, surfing, kayaking, and walking the beach.
- The sense of community is part of what makes the town a great place to live.

- The majority of participants involved in clubs and organizations are older, retired residents.
- There is also a sense of community at the bars and hangout spots.
- There are a lot of young business owners that also contribute to the town.
- Young families benefit from Cayucos's great elementary school.
- The biggest health problems include the aging population, restricted access to healthcare, drug or alcohol abuse, and smoking.
- There is a lack of bike infrastructure, access to recreational/exercise equipment and facilities, and active transportation.
- The unfinished skate park and bicycle safety were brought up as issues relating to injury.
- Better biking signs and lighting along the trail and Pacific Avenue could help people bike more, especially in the dark.
- Healthy food is not accessible or affordable. People must grocery shop outside of town.
- The farmers' market is held on Friday mornings, which makes it inaccessible.
- The bus is underutilized by most people, and there are few transportation options.
- Pedestrian safety is an issue along South Ocean Avenue and along Highway 1.
- There is a community pool, but it is not open year-round.
- A private gym or recreation program is missing from town.

- Housing affordability is a concern, and there are unpermitted secondary units and vacation rentals in town.
- There is a lack of jobs, especially high-paying jobs.
- Climate change is a health issue, and will become more of an issue with sea-level rise.
- Governmental red tape and regulations may be barriers to improvements in health.
- Cayucos is not necessarily a “policy” community, and citizens take on issues from the grassroots level.

COMMUNITY GROUP MEETINGS

In order to efficiently gather feedback from community stakeholders, several community groups were contacted to arrange a meeting to discuss the Community Health Plan. Of those contacted, four groups arranged a meeting: the Cayucos Elementary Parent Teacher Association (PTA), the Lioness Club, Rotary, and the Seniors Club, all of which included a presentation about the project and group discussion. Presentation materials can be found in Appendix C: Outreach Materials.

Questionnaires were distributed to individual group members at each meeting. Some completed the questionnaire prior to the group discussion, others during or after, and some individuals did not submit a questionnaire. In a large group or in smaller groups, three questions were posed for a short discussion. The questions were:

- What are the top three contributors to the health of the Cayucos community?
- In your experience, what are the top 3 most important health issues in Cayucos?

- What solutions might you propose to increase physical activity, healthy eating, or to address other “root determinants” of health?

The small groups were then asked to share with the larger group. The group discussions produced some feedback on the topic and suggestions for how to make Cayucos a healthier place. Groups listed the clean environment, climate, and the safety of the town as major contributors to health. The “sense of community” and “smallness” were also expressed to be factors. Dog-friendliness and pedestrian safety were also listed as factors contributing to health.

Traffic speeds around the school and running red lights were both brought up as major problems, especially as a hindrance to increase the number of students walking and biking to school. Drugs and alcohol abuse was mentioned multiple times as a major hindrance to health in Cayucos, a response which was also reflected in the questionnaire data and key informant interview responses. Use of heroin, meth, and tobacco use were as specified as problems. One small group specifically mentioned the rise of e-cigarettes and second-hand smoke as a major issue in Cayucos.

Expressed opportunities for solutions included activities for seniors and recreational opportunities that are age-appropriate. Some suggested that the pool become accessible year-round, or that other recreational opportunities become available. Other specific changes mentioned included undergrounding power lines, protecting the night sky from light pollution, and making Ocean Avenue a pedestrian street throughout the commercial district, with parking areas at either end. Overall, groups seemed interested in the topic, but many people were unsure of what should be changed, if anything, in their community, or how changes could be made. This may have been attributed to the short amount of time allotted for each presentation and discussion, or it may parallel the

idea that preservation of the way of life in Cayucos is very important to many in the community.

Community Group Meetings Key Findings

- Major contributors to health include the clean environment, climate, and beautiful setting.
- Cayucos is a very safe, low crime town with a quick emergency response time.
- The “sense of community” and “smallness” were also expressed to be factors in the overall wellbeing.
- The town is dog-friendly.
- Pedestrian safety was listed as a factor contributing to health.
- Traffic around the school was brought up as a major problem, especially as a hindrance to increase the number of students walking and biking to school.
- Drugs and alcohol abuse was mentioned multiple times as a major hindrance to health in Cayucos. Use of heroin, meth, and tobacco use were as specified as problems.
- One small group specifically mentioned the rise of e-cigarettes and second-hand smoke as a major issue in Cayucos.
- There is a need for activities for seniors and recreational opportunities that are age-appropriate.
- The pool should become accessible year-round, and other recreational opportunities should become available.
- Aesthetic improvements such as undergrounding power lines and protecting the night sky from light pollution are needed.

- Ocean Avenue could become a pedestrian street throughout the commercial district, with parking areas at either end.

CAYUCOS COMMUNITY QUESTIONNAIRES

The questionnaire was developed and distributed in an effort to gather quantifiable data to give an indication of community health levels, access to healthy foods, and sentiments regarding the built environment in Cayucos. The Healthy Communities (CRP 470) class at Cal Poly assisted with this portion of outreach. Further details on the methods of data collection for the surveys can be found in the Methodology chapter.

Distribution of the questionnaire began in February, with surveying ending in late March and final collection on May 31. A total of 82 Healthy Communities questionnaires were collected. The data was compiled and calculated using Excel, and more information about the methods may be found in the Methodology section. Responses to the survey questions are summarized below.

Figure 11 – Question 1: Contributors to Quality of Life, Open-Ended Response, Cayucos

The first question in the questionnaire asked, “*Generally speaking, what contributes most to your quality of life in Cayucos?*” Responses were input and divided into categories to better assess overall opinions. The category with the greatest number of responses was “natural environment”. Some responses in this category included “the weather,” “the beach”, “the beautiful environment.” Responses in the “Community” category were also mentioned very often, in close second to “natural environment.” Many respondents simply wrote, “The people” while others mentioned the “tight-knit” community or the many opportunities to become involved in groups or activities. A closely-related category was the “Location or Small-town Atmosphere” which also included a number of responses. Overall, these responses were very broad, but the group of respondents seemed to agree that the quality of life in Cayucos has to do with the physical environment as well as the people.

Figure 12 -- Question 2: Factors that Detract From Health, Open-Ended Response, Cayucos

A frequent response to the second question, “What do you think makes it most difficult to be healthy or detracts from overall wellness here?” was “nothing”. Of those that did identify an issue or problem, the most frequent responses included some aspect of environmental quality such as “beach debris” or “runoff from streams”. Food access and accessible healthcare were also mentioned frequently. “Personal Choice” answers were mentioned by some respondents, which included responses like “ambition to be healthy” and “workload”. Other frequent answers centered on the need for sidewalks or bike lanes to be improved. For this question, the “Tourists/Renters” category was mentioned also mentioned a few times, although none mentioned specifically why the presence of tourists were affecting their quality of life.

Figure 13-- Question 3: Factors for Improving Quality of Life, Cayucos

The third question asked, “What do you think are the most important community factors for improving the quality of life in a community?” The options with the highest response rate were good schools, clean environment, low crime and safe neighborhoods, good place to raise children, and healthy behaviors and lifestyles. This was true for both the “check all that apply” data and the “choose the three that are most important to you” option. Many respondents did not circle any answers, but the data for the first part of the question was incorporated into the total. The most important factors among those that did circle options were also clean environment, low crime and safe neighborhoods, and healthy behaviors and lifestyles.

Figure 14 -- Question 4: Greatest Impacts on Community Health, Cayucos

The next question asked about community health in general: “What do you think are the most important problems with the greatest impact on community health?” This question yielded some surprising results, with drug and alcohol abuse ranking at the top of the list along with aging problems, cancers, heart disease and stroke, and obesity. For this question, it was unclear whether respondents were giving answers based on any community impacts, or those in Cayucos specifically.

Figure 15 -- Question 5: Self-Identified Personal Health Rating, Cayucos

Over three-quarters of respondents rated their personal health as either “healthy” or “very healthy”. A small number of respondents said that they were “unhealthy” or “very unhealthy”. This finding was also interesting, especially given the aging population and the information presented in the Existing Conditions chapter, which show that a large number of county residents are obese, do not exercise regularly, consume too much sugar, and are diagnosed with chronic diseases that often result from unhealthy habits. However, this data is countywide and does not provide information for Cayucos alone. It could be that Cayucos residents are as healthy as they perceive themselves to be as a result of their lifestyles and perhaps even their location, or this perception of individual health could be skewed.

Figure 16 -- Question 6, Changes that Could Contribute to Health, Open-Ended Response, Cayucos

The sixth question asked, “What should change in Cayucos that could contribute to your personal health of the health of the community as a whole?” Like some of the previous questions, this was open-ended and the results were categorized. This question allowed respondents to provide constructive criticisms of their environment, despite the general consensus that Cayucos is already a very healthy place. This question produced a greater spread of results. Some respondents left the space blank or responded “nothing”. Of those that responded, the three most frequent responses were those about food access, healthcare access, and pollution or concerns about environmental quality.

Figure 17 -- Question 7: Features that Could Contribute to Health, Cayucos

Question seven was similar to question six, but instead of being open-ended, required respondents to check boxes for community features. The question asked, “What community features, if any, could contribute to the health and quality of life in Cayucos?” The answers were also spread across the many options, with a few of the checkbox options being chosen only or two times. It was clear from these responses that safe neighborhoods were not a concern of most respondents, presumably because Cayucos is already considered to be safe. However, sidewalk and bike lane improvements, which may contribute to neighborhood safety, were selected by many of the respondents. Other highly-selected community features included access to healthcare, transit options, and better availability of healthy foods. Although many respondents did not consider Cayucos to have any glaring barriers to health, the community may benefit from many of those built environment improvements which have been shown to impact public health.

Community Health Questionnaire Key Findings

The questionnaire results provide several indications for health and health-related needs in Cayucos.

- The high importance of natural beauty and the small, involved community were apparent in the results.
- Over three-quarters of respondents rated their personal health as either “healthy” or “very healthy”.
- When asked about important factors for a healthy community, the options with the highest response rate were good schools, clean environment, low crime and safe neighborhoods, and good place to raise children.
- The question about the most important problems yielded some interesting results, with drug and alcohol abuse ranking at the top of the list along with aging problems, cancers, heart disease and stroke, and obesity.
- The questionnaires showed that some respondents believe that “nothing” in Cayucos detracts from overall wellness, though many responded that a lack of food access, healthcare access, and pollution or concerns about environmental quality were detracting from health or overall wellness.
- Sidewalk and bike lane improvements, access to healthcare, transit options, and better availability of healthy foods were chosen most often as community features that could contribute to health and quality of life.

COMMUNITY EVENTS

Cayucos Farmers Market: Public Space Improvements

Graduate students in the City and Regional Planning Program at Cal Poly, San Luis Obispo conducted a planning process for the purpose of preserving and improving public space within Cayucos. The project is entitled "Connecting Cayucos: Visions and Actions for Public Space." The proposal includes ideas for parks, streets, and other public spaces. It also considers issues related to parking and economic vitality. This project provided additional public outreach opportunities and community input that helped to inform the Cayucos Community Health Plan.

Outreach included a voting exercise to find out about the desires and needs of community members and visitors, and took place at the Cayucos' Farmers Market on May 23 and May 30th. The studio project centered on five main themes as ways of "Connecting Cayucos" through community identity, accessibility, natural resources, health and safety, and economic vitality. These themes were addressed throughout the options for public space improvements illustrated for voting purposes. The top four ideas voted on by the community included:

- Increase public art throughout town (i.e. benches, murals)
- Build a community garden
- Widen sidewalks along Ocean Avenue to increase pedestrian usage, increase outdoor dining, seating, and plantings to distinguish the downtown
- Expand recreation opportunities at Estero Bluffs and Whale Rock Reservoir by expanding connectivity, adding signage, and providing parking areas

Other ideas were expanding Hardy Park, utilizing sustainable street design to clean and slow runoff and storm water, adding an oceanfront multi-use park for special events, car-

free community spaces, a cross-town community shuttle, extension of bicycle facilities along Ocean Avenue, textured pavement at intersections, and back-in public parking along Ocean Avenue. The results were similar to many of the ideas brought up by the community through the Healthy Community Questionnaire and other forms of engagement. In addition, community members liked the idea of painted crosswalks. Some mentioned that there are mobility issues among the community, and there were concerns that textured intersections could be problematic for seniors , or that removing parking on Ocean Front St could hinder beach access for seniors.

Public Spaces Key Findings

- Several improvements to public space in Cayucos could also serve as health co-benefits.
- Public art is desired throughout town.
- Sidewalks are desired as places to walk, dine outdoors, and enjoy the environment.
- Connections to the surrounding recreational opportunities are needed.
- Mobility issues are a concern in the community, and new public spaces should incorporate features to maximize access.

Cayucos School Outreach

Activities at Cayucos Elementary were conducted on May 24, 2014, in conjunction with the graduate studio class. Cal Poly students brought materials to engage a group of eight graders through a mapping activity. The mapping exercise involved students selecting cutout images of things that were representative of what they liked to do for physical activity; things that would make them feel safer; and things they “wished” were present in Cayucos. Students were also asked to indicate the travel mode and route they

took to school. The exercise concluded with each group collectively discussing the features they would most like Cayucos to have. The students mentioned many ideas for improving their environment, but came to a consensus with the following top ideas: street lighting in dark, residential areas, “smoother” roads for bicycling, a paintball or laser tag facility, indoor basketball courts or other indoor recreational opportunities, an expanded Hardy Park that allowed for active recreation and field sports, a new, bigger arcade in town, outdoor seating, and an expanded farmer’s market or healthy food outlet.

Cayucos School Key Findings

- There is a need for street lighting in dark, residential areas, especially for kids to bike and walk.
- Some changes should be made, but the character of Cayucos should remain.
- Some areas need “smoother” roads for bicycling.
- There is a need for facilities for active recreation, including indoor facilities and play fields.
- More outdoor seating is needed in public spaces and at businesses.
- Kids would like to have healthy food options.

Plan Draft Review Event

The last outreach efforts involved returning to the community with draft goals, policies, and implementation measures for review. This process occurred at an event in a community gathering space, the Veteran’s Hall. This event was a joint effort conducted for the purposes of this project and Professor Main’s Graduate Studio Class, which focused on public spaces in Cayucos. Because the topics overlap extensively, feedback

was gathered for both planning efforts. The feedback from these efforts further informed the project about specific community concerns, perceptions, wants and needs, and strategies for improving spaces and would like incorporated into their community. The council and the public discussed the feasibility of a community garden, how to bring composting to Cayucos, and about the general state of health in Cayucos. The community feedback was recorded, analyzed and considered in the final draft plan.

Key Findings

- The community is interested in building a community garden.
- Waste management is of interest.
- Several improvements to public space in Cayucos could also serve as health co-benefits.

Summary of Key Findings

This section compiles all of the findings and organizes them into themes to guide the interpretation of the wealth of information that will go into the creation of the draft plan. The themes are Participation, Tobacco, Drugs and Alcohol, Pedestrian Activity, Bicycling, Safety Improvements, Healthy Design and Development, Parks and Recreation, Environmental Quality, Healthy Eating, and Access to Healthcare.

Participation

The first major finding truly resulted from the combination of all efforts detailed in the Findings chapter. Many of the 2,431 citizens of Cayucos are active in a number of community groups, and have been very successful in mobilizing their neighbors and supporters in the greater San Luis Obispo area to achieve desired outcomes for their community. This capacity is sometimes referred to as social capital, and its presence in

a community is positively correlated with community security, friendship and community, and a civic identity, which studies show improves mental health, cardiovascular health, and faster recovery from illness (Kawachi, Subramanian, and Kim, 2008). In this way, the findings suggest that the community participation levels are a boon to public health, but collaboration will ensure the success of future projects related to the effort.

Key findings on participation:

- The sense of community and volunteerism contributes to making the town a great place to live.
- Cayucos school is great; an asset for children and young families.
- The majority of participants involved in clubs and organizations are older, retired residents.
- There is also a sense of community at the bars and hangout spots.
- The “sense of community” and “smallness” were chosen by participants as factors in overall wellbeing.
- Cayucos is not necessarily a “policy” community, and many community accomplishments begin at the grassroots level.
- There are a lot of young business owners that also contribute to the town.
- When asked about important factors for a healthy community, the options with the highest response rate included good schools, low crime and safe neighborhoods, and good place to raise children.

Tobacco, Drugs, and Alcohol

The effects of tobacco use, second-hand smoke, and the carcinogenic properties of nicotine continue to be a leading cause of death in California. Electronic cigarettes

represent a recent issue for tobacco use because of unclear policy throughout the county and the attractiveness of e-cigarettes to youth. Residents in Cayucos are concerned about the rate of smoking and problems with drug and alcohol abuse in their community. Smoking is not currently banned in downtown Cayucos, and smoking is prevalent especially late at night. Concern over alcohol and drug abuse in San Luis Obispo County remains steady, although binge drinking rates and youth substance abuse have declined. There are three unhealthy food outlets in Cayucos, and only one small market which sells alcohol but no tobacco. The proximity of these unhealthy outlets near schools and parks is also of concern.

Key findings on tobacco, drugs, and alcohol

- Drugs and alcohol abuse was mentioned multiple times as a major hindrance to health in Cayucos. Use of heroin, meth, and tobacco use were as specified as problems.
- One small group specifically mentioned the rise of e-cigarettes and second-hand smoke as a major issue in Cayucos.
- Participants listed drug and alcohol abuse as the top ranking at the top of the list of most important problems in Cayucos, along with aging problems, cancers, heart disease and stroke, and obesity.
- Participants included drug or alcohol abuse and smoking at two of the biggest health problems.

Researchers and public health professionals in tobacco cessation and prevention utilize strategies such as reducing tobacco advertising, enforcing penalties for selling alcohols and tobacco to minors, and providing free products and services to those with unhealthy addictions. The department of Behavioral Health provides treatment and recovery

services for those with drug and alcohol problems. The findings suggest that there is a need to increase awareness of such programs, increase accessibility of County programs, and limit the exposure to such substances.

Pedestrian Activity

A foundational U.S. Surgeon General's Report on Physical Activity and Health (1996), concluded people of all ages who are generally inactive can improve their health and well-being by becoming even moderately active on a regular basis. Research has found multi-level social ecological factors such as urban aesthetic, perceived safety, accessibility, and opportunity for social interaction to be motivating factors for increased physical activity (Lee & Moudon, 2004; Brownson, Baker, Housemann, Brennan & Bacak, 2001).

Though pedestrian activity throughout Cayucos is not as limited as in other areas of the county, there are many areas throughout the commercial core and connecting to residential areas that could benefit from improved pedestrian infrastructure. Though most Cayucos students are driven to school, when asked what would encourage active transportation to school, the largest numbers of responses were living closer to school, sidewalk or street improvements, and crossing guards--all of which have to do with pedestrian safety. Students attending Cayucos Elementary and seniors on the whole were particularly interested in improved walking environments.

Key Findings on Pedestrian Activity

- Pedestrian safety is an issue for those on the east side of Highway 1, for people walking and biking downtown on Ocean Avenue, and near the school.
- Participants were supportive of widened sidewalks and increased outdoor seating areas.

- Pedestrian safety was listed as a major factor contributing to health.
- Traffic around the school was brought up as a major problem, especially as a hindrance to increase the number of students walking and biking to school.
- Pedestrian safety is an issue along South Ocean Avenue and along Highway 1.
- Sidewalk improvements was one of the options chosen most often as a community feature that could contribute to health and quality of life.

Pedestrian-friendly areas allow for low-impact exercise for the elderly, accommodate the incorporation of daily walking to destinations and as a social activity, and accommodate individuals without access to vehicles. Pedestrian activity also invites window-shopping and increased consumer traffic for businesses and increases random encounters with others in the community, which increases neighborly connections, a feeling of belonging, and brings with it improved mental wellbeing. These findings suggest that there is ample room for improvement in pedestrian infrastructure throughout Cayucos.

Bicycling

Bicycling allows for active transportation at greater distances and speeds than walking, provides connections between residences and transit stops, and is a highly accessible form of transportation for all ages and income levels. Like walking, riding a bike to services and frequent destinations incorporates physical activity into daily life, helping to increase the chances that the rider experiences the countless health benefits of regular exercise.

Key Findings on Bicycling

- Bike lane improvements was one of the options chosen most often as a community feature that could contribute to health and quality of life.

- There is a lack of bike infrastructure such as bike racks, biking signs, smooth paths and lighting.
- The bike trail along the cemetery needs improvements.
- Street lighting along the bike trail, along Pacific Avenue, and in residential areas could help kids and adults bike more, especially in the dark.
- Complete the path to Morro Bay.
- Bicycle safety was brought up as an issue relating to injury.
- Segments south of 8th Street along Ocean Avenue ranked consistently low overall in terms of walkability and bike-friendliness.
- The Ocean Avenue and Pacific Avenue intersection ranks low in overall walkability.
- Segments along 13th Street, which connects Ocean Avenue and Pacific to the neighborhoods to the east of Highway 1 ranked consistently low in terms of walkability and bike-friendliness.

Cayucos is located along the Pacific Coast Bike trail which follows Highway 1 along the coast. The climate and scenery make Cayucos a great place to bicycle for avid cyclists, casual bikers, and commuters. However, most roads lack a safe amount of lighting, there are few places to park a bicycle, and there have been several bicycle-vehicle collisions in Cayucos. Cayucos Elementary students were also asked to indicate the travel mode and route they took to school; most of them were dropped off by their parents in a car. The students mentioned many ideas for improving their environment, but came to a consensus on a few ideas including street lighting in dark, residential areas and “smoother” roads for bicycling. The findings will help to support accommodation for and encourage use of bicycles.

Safety Improvements

In 2008, the Physical Activity Guidelines Advisory Committee reported findings from amalgamated scientific literature on the health benefits of exercise, including that the benefits of activity far outweigh the possibility of adverse outcomes. However, physical activity can expose individuals to risks for injury, due in part to the high priority of accommodation of vehicles and the incomplete adoption of designs and practices for injury prevention in our environments. Seniors are more susceptible to falls, and a large number of injuries are attributable to falls while using footpaths or sidewalks.

Key Findings on Safety Improvements

- Sidewalk and bike lane improvements were two of the options chosen most often as community features that could contribute to health and quality of life.
- The street segments in the commercial core along Ocean Avenue that ranked highest in walkability overall ranked slightly lower for the safety category, largely for injury risk and traffic safety issues.
- The unfinished skate park and bicycle safety were brought up as issues relating to injury.
- Lack of street lighting was mentioned as a concern.
- Cayucos Drive ranked high in the safety category due in part to the number of crossing aids and other signage.
- Pedestrian safety is an issue for those on the east side of Highway 1, along South Ocean Avenue, and near the school.
- Sidewalk improvements was one of the options chosen most often as a community feature that could contribute to health and quality of life.

- Cayucos is a very safe, low crime town with a quick emergency response time.

There have been several pedestrian and bicyclist deaths in Cayucos in the last ten years that were caused by collisions with automobiles. The walk audit conducted for this plan showed that there is a discrepancy between overall walkability in town and the safety of the streets. This is due in part to the auto-oriented nature of the streets, obstructions in the walking path, and uneven or incomplete sidewalks. These issues are especially relevant for increasing the number of students walking or biking to school, limiting injuries for those needing to cross Highway 1, and individuals with disabilities or limited mobility. The Department of Transportation has studied numerous tactics to reduce injury-by-vehicle and promote health, which they call safety countermeasures. These include features that call a driver's attention to a pedestrian area, naturally cause slower speeds, and increases in physical space for pedestrians and bicyclists. These measures can increase actual and perceived safety and encourage active use of the built environment. Aside from traffic safety issues, most people feel safe in their neighborhoods.

Healthy Design and Development

The modern city, built to accommodate the automobile first and foremost, deters physical activity and the use of alternate forms of transportation. The result of this practice is widespread traffic congestion; increased commute time; increased vehicle, pedestrian and biking crashes and injuries; a growing obesity epidemic; a rise in air pollution and respiratory illness; and a growing sense of disconnection between workplaces and homes (CDC, 2009, p.9). Cancer and heart disease are the leading causes of death in Cayucos by a large margin. Though these chronic diseases are attributable to a number of factors, increasing exercise and healthy eating habits among community members may have a positive impact on these rates.

Key Findings on Healthy Design and Development

- Many residents dislike the abundance tourist activity in town and vacation rental homes, many of which are illegal.
- Affordable housing is lacking in Cayucos.
- The street segments that offer the most in terms of aesthetics are in the core commercial area.
- Some participants supported the idea of a pedestrian street throughout the commercial district, though some are worried about mobility.
- More outdoor seating is needed in public spaces and at businesses.
- Aesthetic improvements such as undergrounding power lines and protecting the night sky from light pollution are needed.
- There is a lack of jobs, especially high-paying jobs.
- There are few transportation options, and the bus is inconvenient.
- The bus is used by younger people, especially to go to the City of San Luis Obispo.
- Sidewalk and bike lane improvements and transit options were two of the options chosen most often as community features that could contribute to health and quality of life.

Cayucos benefits from a highly aesthetically-pleasing natural environment, and a town character that plays off the proximity to the ocean. These characteristics alone serve to encourage active pursuits, and a major result from community outreach efforts showed that this physical beauty is a major contributor to quality of life in Cayucos. However, the small town atmosphere and remote location limit the access to many community needs

without the use of a private automobile. Transit to and from Cayucos is infrequent and time-consuming, which is likely deterring the use of the bus system and increasing the dependence on personal vehicles. Housing is not affordable for many income levels in Cayucos, although the low growth rate in town and high costs for building along the coast may render affordable housing infeasible in the near future. It will be important to preserve the current character of the town while allowing small increases in density, increase opportunities for aesthetic improvements that attract foot-traffic, and connect neighborhoods to services available in town.

Parks and Recreation

It has been estimated approximately 400,000 premature deaths occur annually in the United States as a result of the negative health outcomes which stem from obesity due to physical inactivity (Mokdad, Marks, Stroup, & Gerberding, 2004). Though incorporating physical ability into daily activities can help to “cure” physical inactivity, it has also been proven that living close to parks, trails, and recreation facilities is related to greater use of facilities and more recreational physical activity (Sallis et al., 2011, p. 33).

Key Findings on Parks and Recreation

- There is a need for facilities for active recreation, including indoor facilities, play fields, and a gym or exercise classes.
- There is a need for activities for seniors and recreational opportunities that are age-appropriate.
- Especially south of the commercial core, many residents do not have convenient pedestrian access to a park.

- With the inclusion of the several beach access points, parks are accessible by most residences in Cayucos.
- The beach and proximity to the ocean provided ample opportunities for active pursuits, including mountain biking, surfing, kayaking, and walking the beach.
- Cayucos needs 27 additional acres of parks, especially active parks.
- There is a community pool, but it is not open year-round.

Parks, hiking areas and additional facilities including the community pool, tennis courts, and school facilities serve the community. Because many residents of and visitors to Cayucos also have access to the beach for exercise such as walking, running, kayaking, or surfing, recreation is accessible by most residents in Cayucos. However, many residents, especially elementary students, expressed a need for parks that are better suited to active recreation, such as team sports. County residents reported wanting more hiking trails, bike paths, and natural areas in their communities. Cayucos Elementary students are also in need of physical fitness improvements, and increased sports programs or after school activities were also the number one choice for parents when asked what could increase physical activity for their children.

Environmental Quality

Humans are affected by the environmental quality in the places they live, work, and visit. In particular, people are affected by air and water quality. Acute and long term air pollution due to ground level ozone and particulate matter has been shown to have negative impacts on health. Ground level ozone is that main component of smog, and is caused by the emissions of industrial facilities and electric utilities, motor vehicle exhaust, gasoline vapors, and chemical solvents (EPA, 2012). The County of San Luis Obispo often falls into non-attainment status for air quality, meaning that the air quality is

below state standards. However, measurements near Cayucos usually do not show that air quality is below this state standard.

Stormwater runoff, the water that flows to the storm drains during and after a rain event, contributes to microbial contamination of water supply, especially after rainfall (Gannon and Busse, 1989). There is a strong relationship between large rainfalls and outbreaks of waterborne diseases. Much of the contamination is from non-point source pollution, with major sources including runoff from farms, parking lots, streets, and golf courses. Water-related illnesses can be caused by microbial or chemical contamination from pesticides, metals, nitrates, pharmaceuticals, and organic chemicals. Waterborne illnesses can be caused not only by drinking contaminated water, but also by eating produce irrigated with untreated water, eating seafood caught in contaminated water, and swimming or other recreation in polluted water (Craun, 1992). Water pollution affects people locally in Cayucos because of location at the ocean shore, where many residents and visitors enjoy the beach and the waves.

Key Findings on Environmental Quality

- Physical and environmental beauty is a major factor contributing to health in Cayucos, especially because it adds to the willingness of residents to recreate outside and provides mental health benefits.
- Major contributors to health include the clean environment, climate, and beautiful setting.
- Climate change is a health issue, and will become more of an issue with sea-level rise.
- Governmental red tape and regulations may be barriers to improvements in health.

- When asked about important factors for a healthy community, the options with the highest response rate were included “clean environment.”
- “Pollution or concerns about environmental quality” was one of the frequently noted issues detracting from health or overall wellness.

Just as many community members mentioned the beautiful natural environment as a great asset to their quality of life, pollution and issues of environmental quality were mentioned again and again. North coast residents are very concerned with water quality and availability (ACTION, 2013). Issues in Cayucos range from contaminated runoff pollution to solid waste management. Poor environmental quality affects Cayucos locally, but is an issue with that originates at the regional level.

Healthy Eating

Though personal diets may be thought of as the responsibility or choice of the individual, the accessibility and affordability of healthy food plays a role in what a community eats. Inadequacies in the local food system impacts communities, especially in terms of public health. The most accessible foods—in convenience stores and fast-food outlets—are high in calories but low in nutritional value. The production of nutrient-rich foods can even threaten regional environmental quality due to the methods used to produce, process, package, and transport the goods. Access to affordable grocery stores and farmers markets increases the likelihood that people will eat healthy food, while those surrounded by convenience and liquor stores are less likely to eat healthy food (Corburn, 2009, p. 80). The food system, good or bad, is impactful to the well-being of communities of all socioeconomic kinds, though the poor are generally more vulnerable to problems of food access (Corburn, 2009).

Key Findings on Healthy Eating

- There is a lack of healthy food outlets and options in Cayucos, and the food that is in town lacks variety and is expensive.
- The only store with healthy items is the Cayucos Supermarket, located on South Ocean Avenue
- There are three unhealthy food outlets in Cayucos which sell only candy, chips, sodas, tobacco, and similar items.
- Healthy food is not accessible or affordable. People must grocery shop outside of town.
- Kids would like to have healthy food options.
- The farmers' market is held on Friday mornings, which makes it inaccessible to some residents.
- "Lack of food access" was one of the frequently noted issues detracting from health or overall wellness.
- Better availability of healthy foods was one of the options most frequently chosen as a community feature that could contribute to health and quality of life.

Healthy eating is increasing in the north county, with obesity rates declining and more people consuming enough fruits and vegetables. However, only 48% of adults on the County are consuming the recommended amount of fruits and vegetables. In Cayucos, community members expressed the need for healthy food options, including a health food store, a larger grocery store, healthy, affordable eateries, and access to locally-grown food. Weekly grocery shopping is nearly impossible in Cayucos due to the unavailability of many items, and prices are commensurate with the vacation-town setting, therefore not affordable for residents. According to the Retail Food Environment

Index (RFEI), there are three unhealthy food outlets in Cayucos, and only one small market which sells alcohol but no tobacco. This presents an issue of food accessibility and affordability for residents, especially those without access to a personal vehicle such as children and the elderly.

Access to Healthcare

There are many aspects to determining the accessibility of healthcare access and the degree to which access impacts individual health. The location of healthcare facilities in a community, such as hospitals, emergency care facilities, and health clinics influence access. However, factors such as transportation to and from facilities, awareness of facilities and services, availability of insurance, and personal preferences have an impact on the degree to which available healthcare facilities can and will be used.

Key Findings on Health Care Access

- The population is aging, and there are health concerns associated with aging problems.
- The most important health problems include the aging population and restricted access to healthcare.
- “Lack of healthcare access” was one of the frequently noted issues detracting from health or overall wellness.
- “Access to healthcare” was one of the options most frequently chosen as a community feature that could contribute to health and quality of life.

In San Luis Obispo County, access to medical care is restricted by increases in cost, higher insurance rates, and proximity to medical facilities. When asked what aspects of the Cayucos community detract from overall wellness, one of the most frequent responses was the lack of healthcare access. Though the vast majority of residents

described their personal health as “healthy” or “very healthy”, many were concerned about aging problems and chronic diseases. The high median age and high percentage of seniors residents in town, coupled with the lack of healthcare facilities in town and limited transit, presents a healthcare access problem for Cayucos residents. Findings suggest that there is a need to increase access to healthcare for the wellbeing of the community.

OCEANO FINDINGS

OCEANO FINDINGS

Introduction

This chapter provides a summary of the findings collected from the parks and food vendor inventory and access assessments, as well as the findings from the outreach activities, including presentations to local advisory bodies, key informant interviews, community survey results, feedback from public events and plan draft review meetings conducted in Oceano.

A physical inventory was conducted to achieve an understanding of the existing built environments and included food, parks, and hydration station access assessment. Results of these studies for Oceano are summarized in this section and displayed in map form.

Community outreach efforts provided valuable feedback and local knowledge from community members regarding physical activity levels, information about the built environment where they live, work, and play, and perceived barriers to healthful activities and food access. For more detailed information on the methods used for conducting the inventory and outreach, see the Methodology section.

Physical Inventory

In order to better understand the built environment in Oceano, a physical inventory was conducted to observe and measure features in a systematic way. The physical inventory included a walkability audit and food, parks, and hydration station access assessments. Results and key findings are displayed and described below.

WALKABILITY AUDIT RESULTS

As noted in both the Methodology chapter and in this chapter's introduction, a walking audit was not deemed necessary due to the fact similar sidewalk inventories had already been previously conducted and of which the data was accessible in the Oceano Specific Plan, the Oceano Revitalization Plan, and most recently (2013) with the Safe Routes to School (SRTS) Infrastructure Survey.

The existing sidewalk inventory map (see Figure 18) taken from the Oceano Revitalization Plan was utilized for this project due to its recent completion, simplicity to read and illustrative appeal. The map provides an aerial view of the town with the Oceano Community Service District boundaries marked in yellow. Streets that feature sidewalks on both sides of the street are in blue. Streets that offer only one sidewalk are noted in green. Finally, streets that possess no sidewalks are indicated in red.

Figure 18– Oceano Existing Sidewalk Inventory Map

Within Residential Areas

The existing sidewalk inventory map clearly illustrates a severely disconnected pedestrian network. Using Oceano Elementary as a center-point (found between Wilmar Road and Paso Robles Street running east to west; and 17th and 19th streets running north to south), the residential areas in closest proximity to the elementary school are without intuitive sidewalk connectivity to either adjacent neighborhood streets, the commercial downtown, or to the school. Much of the southwest section of Oceano lacks sidewalks entirely, forcing pedestrians to walk near the edge of the road and around cars parked on the street shoulders. Only portions of Cienaga Street/Highway 1 and a few small neighborhood residential streets running along the north border of Oceano have complete sidewalks. Sidewalks in the remaining sections of Oceano are intermittently placed, non-existent or poorly maintained.

The Oceano Specific Plan (2002) indicates many of the residential streets lack adequate gutter and curb systems which are necessary for storm water control (p. 20 & 41). Heavy rain can create flooding in these areas that can linger and create additional encumbrances to pedestrian accessibility.

Within the Commercial Retail Core

A number of the main streets along Highway 1, near the commercial and retail core, intersect with the highway at skewed angles which create inordinately long pedestrian crossing points and poor sight lines for motorists. Lack of pedestrian amenities such as street lights, bike racks and benches, along Highway 1 and residential streets reduce walkability and are deterrents to pedestrian activity. As with many of the central residential blocks in Oceano, the commercial retail core is prone to flooding that can act as an added hindrance to foot traffic in the area (Oceano Specific Plan, 2002, p. 17).The

need for improved sidewalk infrastructure in Oceano has been identified and espoused as a primary need in numerous planning documents on the area.

Pedestrian Connectivity to the Beach and County Park

While being in relatively close proximity to both the beach and Oceano County Park, for most of Oceano, walking to either of these destinations can be very problematic, as the lack of designated access paths and prospect of having to cross Highway 1 serve as dissuasive factors. The Specific Plan provides an illustrative description of the inordinate effort needed to access the beach by foot:

Getting to the beach on foot from the Downtown is daunting. The long way is up over the railroad bridge to Pier Avenue along a heavily traveled route. The short cut eventually gets you to the dike along Arroyo Grande Creek down to the beach in front of Strand. This way is the preferred approach for the community, but has several impediments. The traveler must cross Highway 1, cross the railroad tracks, walk along undefined road edges through an industrial packing plant, and navigate several turns before making it to the dike on the Arroyo Grande Creek. (County of San Luis Obispo, 2002, p.35)

The Oceano Revitalization Plan identifies trail connections to the beach as a priority for Oceano residents (County of San Luis Obispo, 2013, p.52). Presently, no such implementation projects have been initiated as of yet.

Findings

- Oceano's sidewalk infrastructure network is incomplete, unattractive and discontinuously patterned, resulting in an unfriendly walking environment that disconnects pedestrians from key destination points within the town.

Oceano's SES profile and the status of its pedestrian network comport with research findings which indicate "Access to recreation facilities, quality and safety of pedestrian facilities, and aesthetics are poorer in areas with mostly low-income and racial or ethnic minority populations" (Sallis et al., 2011, p. 33; Bridging the Gap, 2012, p. 1).

- A lack of clearly marked, safe, accessible paths to the beach and County Park is a hindrance to a large portion (west of Highway 1) of Oceano residents. This finding coincides with research that indicates low-income, ethnic minority communities have less access to recreation facilities, and poorer quality and safety of pedestrian infrastructure (Sallis et al., 2011, p. 33)

PARKS AND HYDRATION STATION ACCESS ASSESSMENT

The parks and hydration station assessment was included to better inform the project as to the community's access to their nearby parks and public drinking water sources. For the purposes of this assessment, parks were defined as areas that were being utilized by the public for active recreation. The parks assessment was conducted using GIS data collected from County of San Luis Obispo's planning department, and field reconnaissance. Both maps show the location of the parks and ¼-mile and ½-mile access by existing streets. The assessment is meant to convey the accessibility of each facility or access point from the residential areas.

The first map (see Figure 19, page 189) shows existing park and recreation spaces in Oceano. A total of 25.58 (not including Oceano Elementary facilities) acres of land is dedicated to recreation space in the community, which account for 3.78 percent of the total land use in Oceano (County of San Luis Obispo, 2002, p. 3). Oceano Memorial Park (County Park) is the community's largest recreation area, located east of Highway 1, north of the airport. It features large open areas (grass) that allow for active

recreation, park benches, barbeque pit, a basketball court and restroom facilities. Across the street, west of the park is an additional, long and narrow strip of green space that runs parallel to the lagoon.

The large recreation field located at Oceano Elementary is utilized by the community as an unofficial space for recreation, sports and physical activities, featuring a large grassy field, a baseball backstop, soccer goals, basketball courts and playground structures. As such, the school grounds were included in the assessment. Its central location in the community core makes it accessible to a larger portion of the community, as illustrated on the maps on page 190 (Figure 20 -- Existing Park and Outdoor Recreation Space Proximity Map with Proposed Space).

The dark purple overlay on the map indicates the community area served within a quarter-mile of the park or recreation area via the existing street network. The lighter purple overlay indicates the community area served within a half-mile. The proximity map indicates the residential areas on the western side of Oceano are adequately served by County Park, though the potential to serve a larger part of the community is hindered by the barrier Highway 1 creates and the lack of a safe, clearly marked access path to the park. Conversely, the centralized location of Oceano Elementary allows access to a much larger portion of Oceano residents. However, the current sidewalk network infrastructure issues specified in the previous walkability findings section impact access to the school facilities and its use.

The second map (see Figure 20, p. 157) a proposed recreation facility on the eastern section of Oceano, and features the same quarter mile and half-mile distance overlay indicators as the previous map. The parcel of land (APN: 062-074-012) is found between 25th, Basin, and S. Elm Street, and is owned by the City of Arroyo Grande, yet it's in the Oceano's Community Service District boundaries. The land use is designated as Public

Facility. Arrangements would need to be made between the county, Oceano and Arroyo Grande, for the land to be purchased or to create a shared-use agreement. The map illustrates the potential added area a park or green space access the proposed area would provide.

Separate hydration station access maps were not created. This was deemed unnecessary due to the fact public drinking fountains are traditionally found at parks and open space areas. As such, the parks assessment maps sufficiently illustrate the potential distance in access area in the community should drinking fountains be installed at County Park and the proposed location, where they currently don't exist.

Findings

- Research has indicated people who live within walking distance (one-quarter mile) of a park are 25 percent more likely to meet the recommended minimum weekly exercise requirements (Saelens, Sallis, & Frank, 2003). A large portion of the community live within one-quarter mile of Oceano Elementary. However, without a formal joint-use agreement with the Lucia Mar School District which would provide accountability and outline responsibilities for maintenance and regulation, over use of the facilities on the school grounds may lead to a *tragedy of the commons* scenario.
- Research has indicated active living behaviors in Latino populations are greatly influenced by access to park and recreation facilities (Lovasi et al, 2009). This notion is supported by feedback garnered in the community survey in which the lack of recreation facilities (i.e. “there are no parks...no recreation centers...gym”) was mentioned in responses most frequently as to what makes it most difficult to be healthy or detracts from overall wellness

Figure 20 -- Existing Park and Outdoor Recreation Space Proximity Map with Proposed Space

FOOD ACCESS ASSESSMENT

The food access assessment was included in the plan in order to analyze the existing availability of food outlets and to help determine need. The assessment was conducted using GIS data collected from San Luis Obispo County and by visits to each of the stores that sell food or beverages. For the analysis of the food retail environment, data was obtained from the local environmental health department to determine the location and type of stores that exist in the study area.

According to the Retail Food Environment Index (RFEI) standards, there are five unhealthy food outlets in Oceano (California Center for Public Health Advocacy, 2007). These stores were primarily convenience markets or gas station shops, selling primarily alcohol, candy, chips, sodas, tobacco, and similar items. Central Market, La Tapatía Market and Deli, and Johnson's market offer a better variety of healthy food items, such

as whole grain bread and tortillas, fruits and vegetables, and reduced fat milk. A fruit and vegetable stand near Tierra Nueva Lane and Highway 1 on the southeast side of Oceano offers an abundance of fresh produce and unprocessed items.

Figure 21 on page 192 shows half-mile to 1-mile accessibility distances based on the street/road network to the healthy food vendors in the community. These vendors are dispersed evenly throughout Oceano, placing most of the community within a half-mile of a healthy and nutritious food source. These areas are denoted by the dark purple overlay on the map. Areas of the community that are within 1-mile of these vendors are denoted in the light purple overlay.

Figure 22 on page 193 shows the locations of the unhealthy food vendors in the community. The map uses the same color overlay scheme with distance areas within a half-mile in dark purple; light purple for areas within 1-mile of a vendor.

Findings

- Healthy food sources are accessible within the community
- The unhealthy food stores are clustered together, reducing access to these vendors. However, the majority of these vendors are located less than a half-mile from the elementary school, which may promote poor food buying choices for neighborhood children
- There are currently no fast food vendors in Oceano
- There are no large chain supermarkets in Oceano
- Currently, only one food vendor accepts WIC, which may limit the ability to buy healthy food options for some residents

Figure 22 -- Unhealthy Food Vendor Proximity Map

Community Outreach

In order to create the most accurate, appropriate and relevant Oceano Community Health Plan, community outreach was conducted in an effort to elicit public participation and garner valuable feedback from community members regarding topics such as physical activity levels; preferred exercise activities; perspective of the built environment in which they live, work and play; and perceived hindrances and desires in their community. The outreach efforts were comprised of the following:

LOCAL GOVERNMENT AGENCY PRESENTATIONS

Presentations were conducted on Jan 22, 2014, before the CSD, and on Jan. 27, 2014, before the OAC. The presentations served to announce my presence in the community and state what my intentions would be while working there, as well as to provide the scope and details of the project and ask for their support. In addition, the presentations

informed the project by providing a platform to engage with politically active community members that have in-depth knowledge of both historical and contemporary issues in Oceano.

The board members of the CSD and members of the OAC both provided feedback at the end of the presentations, suggesting locations within the community to conduct surveys, mentioned sidewalk infrastructure and street lighting as primary needs, and were mostly supportive of the project's overall intention and stated goals. However, a few board members of the CSD were specifically critical of the scope of the project's subject matter believing issues such as drug abuse, needle-share programs and homelessness were not being addressed. It was explained to the board that these concerns, while legitimate community issues, were beyond the scope of the project's research investigation; that being the role of the built environment and its impact on public health. Both agencies agreed that they would be interested in having me return to present the project's findings and provide a copy of the final document once completed.

Findings

- The role of the built environment on public health is a new concept for some local officials. More effort needs to be made by the public health and planning departments to better inform government agencies of the connection and its importance
- Some advisory council members felt the time, energy and resources used by the County Health Department would be better spent trying to help assist the homeless and drug addicts in the community
- Sidewalk infrastructure and street lights were mentioned as a primary needs for the community

KEY INFORMANT INTERVIEWS

The following section discusses and analyzes the results of interviews and group meetings with representatives from the community. Discussions centered on health issues, community priorities, assets and factors contributing to health, and barriers to improving health in the community. Key informants included employees of local government, community service groups and family resource centers, whom have extensive knowledge of Oceano and its residents. The same questions were asked of each key informant, though conversations sometimes centered on related topics. Questions and compiled answers are included below.

Question: *In your experience, or based on your work with the organization, what would you say are the top 3 or 4 most important health issues in Oceano?* Answers to this question were varied, but childhood obesity was identified by all interviewees as an issue within the community. The lack of sidewalks, streetlights, concerns over safety, lack of recreation destinations (i.e. parks and open space), and scarcity of healthy food options were all mentioned as hindrances to physical activity. One interviewee said the following:

Obesity is definitely a problem for both adults and children. My own experience; my own son; teenagers and what they eat—they don't eat healthy. There is nothing in the community available to them—nothing locally to benefit them.

Additionally, cultural barriers and lack of nutrition education were specifically mentioned as barriers that must be addressed; one informant provided the following related anecdote:

We have a literacy hour where parents bring in their toddlers. The mothers were talking about how the doctors were telling them they need to ease off of feeding them because they (the children) were becoming overweight [...] they need education. The mothers couldn't believe it. In a Mexican household, feeding you is loving you.

Question: *Are the health issues you mentioned priorities for your organization, or are there any programs in your organization that are related to these issues?* Two of the interviewees who work for a family resource center both said they network with health organizations such as Dignity Health, which offer exercise and healthcare classes. Another interviewee, who works for a youth organization within the community, said they do focus on healthy eating habits, providing a workshop twice a week in which they do physical activities and discuss healthy eating choices. The same individual mentioned the lack of free public recreation facilities in the community, noting the cost to utilize the Oceano Community Center as prohibitive. The dearth of available options that would interest teenagers was also mentioned as problematic. Arrangements with gym facilities outside of the area are typically made, but these are not available to the groups on a regular basis. "We have worked with Grover Beach CrossFit in the past. We also go to the gym in Pismo Beach to workout, because the gym available for us to use here (Oceano) costs us money."

Question: *How would you describe the overall health of the Oceano/Cayucos community?* Follow up: *Are there any health issues that seem to be impacting particular groups (children, teenagers, elderly, etc.)? Are there certain neighborhoods or geographic areas that have unmet needs related to active living?* Childhood obesity was again identified as a primary concern by the key informants. The homeless in Oceano, specifically those found near the train tracks, were suspected as groups that may have

issues related to drug abuse. The informants who had intimate experience dealing with individuals and community groups felt the health issues in Oceano were generally the same for everyone, being that Oceano's physical dimensions are so small. One interviewee elaborated on the health issues of the specific groups they worked with, "a lot of our moms are dealing with diabetes—but definitely both (children and adults)," they added "We have young, 30-40 year old people having heart issues too." Another mentioned "A community pool would be great. A lot of these kids don't know how to swim," an irony being that Oceano is located in such close proximity to the ocean.

Question: *Would you consider Oceano a physically active community?*

Follow up: *Can you tell me more about how the built environment in Oceano may be preventing people from being more active?* Two of the informants (whom were interviewed together) gave a definitive "no" when asked this question, stating "I think a lot of it has to do with the environment—with gangs and drug users," continuing "another thing is when it gets dark, it really gets dark." These statements echoed a lot of the sentiments received from community feedback. This corresponds with research that perceptions of safety (i.e. the lack of) and lack of built environment amenities such as street lamps can alter active living behaviors. A different informant found it difficult to provide a definitive answer to the question, stating "You do see people walking and jogging, but it's unclear if they are from here or not. Kids are on the street playing because we don't have sidewalks." All the interviewees agreed that physical activity levels would increase if there were more opportunities and facilities that would allow for it, and mentioned the elementary school as the unofficial park that's most accessible for the community to use—"kids jump the fence [at the school] to use the soccer field." When asked to specifically name what may be hindering (physical, cultural, psychological barriers) residents from being more active, one informant responded "Sidewalks. There are no sidewalks for safety [...] no places to ride bikes in safe areas;

the roads are narrow. No activities,” The built environment was the common denominator, but other reasons were forwarded as well. “Nutrition and physical activity are not really strong parts of Hispanic culture—it’s a new concept [the expectation is] go to school and do your homework.”

Question: *Do you think that food is accessible, available, and affordable in the community?* Food accessibility and availability within Oceano was not identified as an issue by the informants. However, affordability was mentioned as a problem for some community members. “I have a family that said they were spending all their money at Central Market [...] they have affordable fresh produce, but many of their other items are two to three times more expensive.”

Many low-income families were said to be going outside of Oceano to Santa Maria to find better value. One informant lamented “The markets have reasonable prices on some items, but I see older people walk all the way to Vons to more for their money.” The topic of nutrition education was brought up as a barrier to healthy eating choices. Decisions regarding food choices may be influenced by simple availability rather than nutritional quality. “We do a food distribution each month where we hand out nutritious foods, but I don’t know how many of our families know the importance of eating the right types of fruits and vegetable [fresh vs. canned].”

Question: *Do you believe there are barriers to enacting policies and creating community support related to active living and healthy eating?* This question provoked responses that provided very different perspectives. One informant noted political apathy as a major factor in not getting community support for policies that would benefit the community, stating

There is no community involvement. You go to the board meetings and there isn't any community members getting involved. I don't think the public know they have the opportunity to speak; they don't want to stir things up—people just want to live in peace.

Others described feeling like bystanders, powerless to create change, watching the needs of others (neighboring communities) be attended to. "We feel like we're being bypassed, whereas Arroyo Grande or Grover Beach get more attention offered to them."

Question: *Do you know of any specific "champion" or "champions" for health in the community?* Only the *Promotores* Collaborative was mentioned specifically. The *Promotores* are community health workers that serve low-income, underserved populations that have less access to health care resources and facilities. They work independently, with local non-profit agencies, county or state governments to educate communities on prevention, health and wellness.

Question: *Do you think local government funds should be spent to support health policy actions?* Without providing specific policy actions they wish to see supported, the informants all affirmed the notion that local government funding should be used to support policies that will improve health outcomes in the community.

Findings

- The presence of gangs and illicit activity has decreased the perception of safety and security in Oceano, which in turn influences the desire for some community members to do physical activities such as walking or jogging
- Stray dogs were brought up as another contributing factor to negative safety perceptions

- Cultural and traditional values may be barriers to learning and modifying health behaviors for certain segments of the community
- The need for parks and free public recreation spaces was identified as a need
- The Oceano Community Center is too expensive for many families to use with regularity
- The community needs nutrition and preventative health education

COMMUNITY EVENTS

Oceano Elementary Event

On February 21, 2014, a survey and mapping exercise was conducted with Mr. Jim Dececco's 6th grade class at Oceano Elementary. A mapping exercise that involved students selecting cutout images of things that were representative of what they liked to do for physical activity; things that would make them feel safer; and things they "wished" Oceano had. Students were also asked to indicate the travel mode and route they took to school and back, in addition to any other destinations they frequently visited in the community.

The exercise concluded with each group collectively discussing the features they would most like Oceano to have. Skate and water parks, football field, basketball courts, and trees were among the most commonly mentioned.

A brief six-question survey was conducted prior to the mapping exercise, and inquired about the students' physical activity behaviors, eating habits, and "wishes" regarding recreation facilities. The six questions and accompanying survey results are found in Table 36, Oceano Survey Results.

Table 36 Oceano Survey Results

Q1	Answer choices	Total	%
What types of activities do you do for physical activity while not in school?	Playing sports	19	0.86
	Going for a walk	11	0.50
	Running	8	0.36
	Riding a bike	7	0.32
	Skateboarding	6	0.27
	Dancing	5	0.23
	Swimming	4	0.18
	Hiking	4	0.18
	Jump rope	3	0.14
	Kickball	3	0.14
	Dodgeball	2	0.09
	Other	0	
Q2	Answer choices		%
Where in Oceano do you go to be physically active?	In your front or backyard	10	0.45
	At your school	9	0.41
	Somewhere outside of Oceano	6	0.27
	Boys & Girls Club	5	0.23
	On the street or road	3	0.14
	Oceano Community Center	3	0.14
	The beach	3	0.14
	Other	0	
Q3	Answer choices		%
Which one of the following things would you like to see in Oceano?	More playgrounds	11	0.50
	Outdoor basketball courts	10	0.45
	Football field	9	0.41
	Better sidewalks	7	0.32
	A skate park	6	0.27
	Water fountains	6	0.27
	Soccer field	5	0.23
	Park and recreation areas	5	0.23
	More bike racks	4	0.18
	More benches	4	0.18
	Healthier places to eat	1	0.04
	Other	0	
Q4	Answer choices	Total	%
What is preventing you from being more physically active?	There isn't much to do outdoors in Oceano.	9	0.41
	It's hard to walk in some places because	6	0.27
	I don't feel safe in some neighborhoods	6	0.27
	I don't feel there are things preventing me	5	0.23
	There are a lot of stray animals (example:	2	0.09
	Other	0	
Q5	Answer choices		%
Do you feel Oceano is a place that allows you to be physically active?	Yes		0.36
	No		0.23
	I don't know		0.32
Q6	Answer choices	Total	%
When you're not eating at home, where do you go to buy food?	Vons	9	0.41
	A market	5	0.23
	The convenience store	4	0.18
	Other	3	0.14
	A taquería	1	0.05
	*three did not respond		

Findings

- Sixth graders expressed a strong desire/need to be physically active outside of school
- Children are walking, but need further pedestrian infrastructure to promote activity and safety
- Areas around 17th and 19th Streets were identified as places that felt unsafe
- They want park and recreation facilities such as basketball courts, skate parks and bike trails
- Safety concerns, lack of sidewalks and general view that there is nothing to do in Oceano impacts their decisions to be physically active or not
- 41 percent (9 students) of the respondents said they go to Vons to buy food
- Survey responses (41 percent; 9 students) suggest the perception that “there isn’t much to do outdoors in Oceano” is preventing students from being more physically active

Day of the Child Event

On April 27, 2014, an information booth was reserved for the Day of the Child event held at the Oceano Community Center in Oceano. This annual event is well-attended by community members, with approximately 300-400 at this year’s event. My participation at the event was primarily for informational purposes, providing visitors a looped PowerPoint visual that described the Oceano Elementary event, as well as large printed graphic displays which provided selected results from the community questionnaire.

However, a large scroll of blank paper was provided at the table and visitors were asked to list features they would like to see in Oceano. More than 60 suggestions were collected, with answers ranging from improved sidewalks, parks and recreation areas,

and street lamps. Outside of built environment features, a desire for particular facilities and land use developments such as health care clinics and a commercial center were regularly mentioned. Non-physical features such as an increase in police presence, security and overall safety were commonly listed by respondents. These answers corresponded with community feedback received from the other outreach efforts mentioned in this chapter.

Findings

- Safety and security concerns came up prominently among responses; requests for more patrols, less gangs and vandalism were suggested
- The need for street lights, additional parks, after school activities for children, sidewalks, and medical centers were commonly mentioned by booth visitors
- Family and social service groups have a strong influence in the Hispanic/Latino community in Oceano
- Hispanic/Latino parents in Oceano are strongly motivated by efforts which seek to improve the lives of their children

OCEANO COMMUNITY QUESTIONNAIRE

Distribution of the questionnaire began in February on through late March. Surveys were conducted in-person throughout the community, at locations frequently visited by residents, such as Central Market and La Tapatía Market & Deli. However, a large number of the surveys were conducted in-person via door-to-door knocking by Oceano Promotores volunteers. A total of 124 questionnaires were collected.

Figure 23 – Survey Question: Contributors to quality of life in Oceano

Survey respondents were asked (see Figure 23), “*Generally speaking, what contributes most to your quality of life in Cayucos?*” However, the phrasing of this question does not translate well to Spanish, so the question was rephrased to “What do you like most about Oceano?” Responses were input and divided into categories to better assess overall opinions. The category totaling the greatest number of responses were answers relating to “feeling” such as feeling safe or being in an inviting environment. The category totaling the second highest number of responses was “the community.” Examples of answers placed under this category were “my neighbors”; “the people”; and “social life.” The third most responded to category was “physical dimensions.” Answers that were placed under this category described Oceano as a “small town” or “small community.”

Figure 24 – Survey Question: Factors that detract from health and wellness in Oceano

Survey respondents were asked (see Figure 24), “What do you think makes it most difficult to be healthy or detracts from overall wellness here?” Answers such as “there are no parks,” “no places to play,” and “no recreation centers” were categorized under “Lack of amenities” and yielded the most responses to the question. “Infrastructure” was the second most categorized response with answers such as “no sidewalks,” “no bike lanes,” “no places to exercise,” and “no parks” being the most commonly written types of answers to the question. In order, the categories “Safety” and “Education” followed after, resulting in 19 percent and 15 percent of the total responses from those that attempted to answer the question. Clearly, the community has voiced its opinion that features of the built environment in the form of land use and infrastructure is hindering their ability to be healthy.

Figure 25 – Survey Question: Perceptions of personal health

Survey respondents were asked (see Figure 25), “How would you rate your own personal health?” The respondents were asked to choose from the following descriptors: “Very unhealthy”; “Unhealthy”; “Somewhat healthy”; “Healthy”; “Very healthy.” Half (50 percent) of all respondents which answered the question (120 total responses) viewed themselves as “Somewhat healthy.” Interestingly, one-quarter (25 percent) of respondents had negative perspectives of their own health, describing themselves as either “Unhealthy” (12 percent) or “Very unhealthy” (13 percent). Further, more people described their personal health as “Very unhealthy” (16 responses) than those that perceived themselves to be “Very healthy” (3 responses).

Figure 26 – Features that would Improve Personal Health

Survey respondents were given an open-ended response question which asked (see Figure 26) "What should change in Oceano that could contribute to your personal health or the health of the community as a whole?" The opinions were grouped into categories to better assess overall opinions. For this question, the categories were "Amenities"; "Safety"; "Infrastructure"; "Community services"; "Healthcare services"; and unrelated answers that were grouped into "Others." The majority (36 percent) of respondents gave answers such as "parks," "recreation centers," "playgrounds," and other answers which could be categorized as added recreation or facility features. The next highest response rates (15 percent) were answers that were placed into the categories relating to "Safety" and "Infrastructure."

Figure 27 – Prioritized Community Features most Important to Oceano

Survey respondents were asked (see Figure 27), “What community features, if any, could contribute to the health and quality of life in Oceano?” They were asked first to checkmark all that applied, and then were asked to prioritize three answer choices they felt were most important. The pie chart represents the prioritized answer choices.

Findings

- Notions regarding safety (i.e. “factors that would improve quality of life...features that could contribute to quality of life...what makes it most difficult to be healthy...”) were a common theme receiving high response rates throughout the questionnaire
- The lack of surety of personal health with such a large number of respondents may indicate individuals in the community may be maintaining unhealthy lifestyles, putting themselves at risk for immediate or long term health risks. An increase in health and nutrition education could benefit community members by

informing them of the dangers of unhealthy lifestyle behaviors, and educating them on the benefit of healthy and active living.

- Answers categorized generically as feeling, community and physical dimension ranked as the top three responses to what respondents liked most about Oceano
- Amenities and facilities (i.e. parks, recreation, playgrounds, et cetera) were mentioned most frequently as the thing that could contribute to their own personal health or the health of the community as a whole
- Lack of amenities and facilities (i.e. “there are no parks...no recreation centers...gym”) were mentioned in responses the most frequently as to what makes it most difficult to be healthy or detracts from overall wellness

Summary of Key Findings

Several common themes, voiced by the community, developed as information was collected from the outreach efforts. The following is a summary of key findings stemming from those themes which helped shape the goals, objectives, policies and actions later outlined in this project.

Obesity and Physical Activity

The health benefits of regular physical activity, even at moderate levels, are well-established; weight management, mental and physical well-being, and resistance to many chronic and preventable diseases stem from active lifestyle. Obesity risks are correlated to sedentary lifestyle behaviors, which are influenced by a multitude of socio-ecological factors, including planning decisions that can impact an individual's (or community's) ability to live a healthy and active lifestyle.

- Obesity was identified as a major health concern by the community, though the concerns were primarily directed towards children versus adults
- Cultural and educational barriers were said to be hindrances that needed to be first addressed in order to elicit behavioral changes
- The rates of *screen time* (computer, television, videos, texting, et cetera) for South County Area (of which Oceano belongs to) children has increased to more than 10 hours per week (Action, 2013, p. 109)

During interviews with key informants who work closely with families in the community, it was said the notion of maintaining healthy diet and physical activity for long term health benefits was not a primary concern for first generation Latino community members, and therefore those values are not known or passed on to those belonging to the younger generation. The community survey provided insight into residents' perceptions of their own personal health levels. Half of the all respondents viewed themselves as "somewhat healthy." Perhaps even more revealing was that a quarter of respondents deemed their personal health as "unhealthy" to "very unhealthy." Beyond incorporating planning decisions and urban design that will affect the built environment, a strong health education component must be part of any comprehensive strategy meant to create positive health outcomes in Oceano. One possible planning and design solution would be to create a partnership that would allow use of a facility for free, regularly scheduled health awareness and education classes (Dannenberg et al., 2011, p. 140).

Healthy Food Access and Affordability

Access to fresh produce and nutritious food sources is vital to helping maintain a healthy diet which can help reduce the risk of obesity and diet-related diseases. Declining physical activity rates and increases in obesity rates in the U.S. have been accompanied by the increased availability of less nutritious foods, such as prepackaged, highly

process, high sugar and fat dense foods, which are typically found in small convenient store and gas station markets (Raimi + Associates & Transportation and Land Use Collaborative of Southern California [TLUCSC], 2005, p. iv).

- Healthy food vendors are well dispersed throughout the Oceano community
- Affordability, rather than accessibility was identified as a greater issue among residents
- Studies have indicated that large chain supermarkets are inequitably distributed, with fewer types of these stores per capita in lower income communities when compared to higher income communities (Raimi + Associates & TLUCSC, 2005, p. iv)
- A study conducted in Atlanta suggests fewer healthy food sources are within walking distance in low-income communities than higher-income communities (Glanz, Sallis, Saelens, & Frank, 2007)
- Many residents go outside of town to access the large chain supermarkets that offer a wider variety of food options and affordable prices than what is found in the smaller markets in Oceano

Lack of food access and healthy food options were not regularly mentioned by the community. This is likely due to the availability of food outlets (three markets and various produce stands) that serve fresh fruits and vegetables in the community.

However, affordability was stated to be an issue by key informants. The produce available at the markets in town were said to be affordable, but many other food items (not specified) were said to be overpriced, which leads to people traveling out of Oceano to larger chain supermarkets in Santa Maria and Grover Beach. Research findings indicate the availability of large chain supermarkets in low-income Hispanic

neighborhoods is less than that which is found in predominantly White or Black neighborhoods (Powell et al., 2007, p. 190).

A large chain supermarket is not likely feasible for a community like Oceano. However, community design that provides safe and easy pedestrian, bike and transit options to healthy food sources, as well as land use decisions which allow opportunities for increasing healthy food vendors, resulting in a competitive pricing environment which can benefit a community's overall nutritional health.

Community Design, Land Use and the Built Environment

Growing research has demonstrated a strong correlation between the built environment and its effect on public health. In contrast to less-dense, sprawled out communities, community design that provides a mix of compact residential, retail and commercial development, which places an emphasis on walking and bicycling to perform routine daily tasks are associated with raised physical activity levels, decreasing the likelihood of being obese (Lopez, 2004, p. 1577-1578). The designated use, layout, and design of a community's physical structures and environment affect active living behaviors, which influences health outcomes (Aboelata, 2004)

- Oceano children desire an increase in the availability of accessible park and recreation facilities
- Oceano's current sidewalk network is insufficient, incomplete and poorly maintained, placing pedestrians at risk in residential and commercial areas
- Residents believe improved or additional bicycle lanes could improve quality of life in Oceano.
- Mixed use developments that offer a mix of neighborhood accessible retail, restaurants, grocery stores, civic use, open spaces and employment

opportunities have been shown to be catalysts for active living behaviors and improved health outcomes (Raimi + Associates & TLUCSC, 2005, p. iv)

Survey results indicate the community prioritizes improved bicycle and sidewalk infrastructure as a need. The need for additional park and recreation facilities were also mentioned consistently in survey responses and dialogue with community members.

Though the Oceano Community Center (OCC) serves the area as an indoor recreation facility, it was mentioned by interviewees, survey respondents and anecdotally in conversation as being cost prohibitive to use for events. Additionally, some residents felt the OCC lacked diverse activity options (offering only a basketball court) and didn't do enough to reach out to the community in terms of providing activities or classes.

Opportunities should be explored to see if partnerships could be created between the Lucia Mar School District (in charge of running the OCC) and local public and private health entities to provide free, regularly scheduled health education and cessation classes at the facility. Of primary concern is the lack of available medical health care facilities in Oceano. The San Luis Obispo Planning and Building Department planners along with the Oceano Advisory Council can partner to develop creative ordinances and permitting that can help recruit medical care providers into the community.

Perceptions of Safety and Security

Multiple research findings have indicated feelings related to personal safety and security were behavioral motivators which help determine whether community residents will be physically active (Minnesota Department of Health, 2012, p. 23). The perceived threat of violence or crime in certain neighborhoods and overall communities can impact decisions to walk for leisure, exercise or even necessity, such as those who walk to work or to a transit stop to travel to work (Jackson & Sinclair, 2012, p. 134).

- Oceano sixth graders identified specific areas in Oceano where they didn't feel safe and avoided
- Gangs were mentioned by both Oceano children and adults as a community issue
- The desire for street illumination at night was mentioned prevalently during outreach activities
- Research has indicated crime rates are influenced by building design and land uses (Baer & Rattray, 2007, p. 4)
- Crime Prevention Through Environmental Design (CPTED) principles can help create a safer environment

Street lights were identified regularly as a need, as the lack of illumination in residential areas in Oceano provoked feelings of fear and safety (lack of) at sundown. Illuminating dark residential and commercial areas are one of the CPTED strategies that can help deter criminal behavior through environmental design. Its strategies are based on the ability to influence decisions that precede criminal acts. For example, pedestrian scaled-lighting, large commercial and residential windows and low landscaping features provide clear sightlines for casual surveillance of on the streets, providing a less inconspicuous environment and opportunity for criminal behavior. CPTED principles should be incorporated into design guidelines for Oceano, or at the very least, policies should encourage the use of these principles in future development proposals. Two primary barriers to health care access are not having health insurance coverage and not have a usual source of care.

Access to Health Care

The health of a population is influenced by a number of factors, including social, economic and environmental circumstances. The availability and proximity of health care facilities, as well as overall quality of service also act as barriers to health care services, in addition the degree of acculturation, English proficiency, and immigration status all impact access to care (Tienda & Mitchell, 2006, p. 410). Recent immigrants are more likely to be unfamiliar and confused with U.S. health care system, which can interfere with receiving appropriate and timely care (Wells, Golding, Hough, Burnam, and Karno, 1989). The inability to speak and understand English proficiently can reduce the ability to understand essential health care information and instruction by a provider, as well as preventative health care and awareness information in a predominantly English speaking country (Tienda & Mitchell, 2006, p. 412). Finally, legal residency status affects eligibility for Medicare or Medicaid insurance.

- According to the 2008-2012 American Community Survey 5-Year estimates, 76.8 percent of Oceano's population are not U.S. citizens
- 28.7 percent of the total civilian non-institutionalized population uninsured; 38.5 percent of Hispanic or Latino residents are uninsured
- 32.6 percent of the population speak Spanish; 14.1 percent speak English less than "very well"
- With the Oceano Community Health Center on Cienga Street closing its doors, the community is now without any primary or ambulatory health care facility within its borders

- “Two key barriers to health care access are not having health insurance coverage and not having a usual source of care” (Tienda & Mitchell, 2006, p. 412)

NEXT STEPS

NEXT STEPS

This project culminates with two separate Draft Community Health Plans, one each for the communities of Oceano and Cayucos in San Luis Obispo County. In order for the plan to reach the project goal to improve community health, raise awareness of the links between the built environment and health, and introduce the conceptual ideas behind the future adoption of a Countywide Health element, the following additional steps may be taken:

- Present the Plan to the County Health Commission.
- Present each plan to the perspective Citizen Advisory Councils. This will help to bring attention to the information provided and raise awareness about key local issues.
- Review goals, policies, and action programs to ensure their feasibility and to gauge community support. Plan elements that are not feasible in the foreseeable future or contrary to community support should be eliminated.
- Disseminate the plan to other organizations, agencies and individuals to build community support around the plan. Make the plan publicly available online on the HEALSLO website.
- Engage in an effort to implement parts of the plans. Engage with the communities of Oceano and Cayucos to prioritize and determine the feasibility of Action Programs listed in the plan, seek funding for projects, and work with the Healthy Communities Workgroup, the Health Commission, Cal Poly, and citizen groups to implement a positive physical change to the built environment or guiding policy change to raise awareness and build excitement about the nexus between planning and public health.

APPENDIX B: CASE STUDY ANALYSIS

APPENDIX B: CASE STUDY ANALYSIS

Title of Plan (and location within document)	Author(s) of Plan	Jurisdiction Type	Population Size	Beach or Vacation Rental Community?	Size of Area (in sq mi)	Details Public Outreach Efforts	Describes Relationship to other General Plan Elements (or General Plan Policies)	Provides Goals and Policies (g)	Provides Implementation Actions (a)	Provides Cost and Phasing Details	Other Unique or Notable Aspects
Emeryville: Ch. 7: Sustainability; subsection "Environmental Health"	Dyett & Bhatia Urban and Regional Planners	City	10,335	Waterfront, but not beach.	2.01 sq mi	No	Yes	Yes	Yes	Yes	Emeryville's PHE is found as subsection ("Environmental Health") under the Sustainability section of its GP. Emeryville has been a leader in sustainable design practices in an effort to curb reliance on fossil fuels, decrease consumption of natural resources and reducing practices that contribute to climate change. They are active participants in GAP and participate in the Urban Environmental Accords, a sustainability program where each city adopts three action items a year to implement in an effort to achieve the Accords. Public health is addressed in numerous sections including transportation where the City is emphasizing alternative modes of transportation to cars. Increased pedestrian and bike pathways availability is a major component of achieving its goal of reducing carbon emissions. Emeryville has specified purchasing and consumption as strategic ways to improve public health and access to healthy foods primary goals for its policies to target. Purchasing policies will increase the purchase of preferred products that are biodegradable and less-toxic. Food purchased from locally grown and organic farms cuts down on exposure to local residents from toxins and other dangerous chemicals in foods.
Vision El Monte: Ch. 11 - Health and Wellness Element	The City of El Monte with contributions from The Planning Center, Amigos de Los Rios, Keyser Marston, The Mobility Group and Transportation & Land Use Collaborative.	City	113,475	No	9.648 sq mi	Yes	Yes	Yes; 14 goals, 86 policies	No	No	El Monte's PHE really makes a case for the connection between public health and the built environment. It provides useful tables that number how many convenience, liquor and fast food restaurants are in the area. It also provides informative blurbs that define key terms for the reader. Additionally, it also provides a reference list at the end of the document for further reading or research. From the website: The physical project component of the P.L.A.C.E. Initiative is a 1-mile circuit walking path with mileage markers and signage connecting various civic, educational, retail and health care facilities in the area. Another valuable outcome of this program has been the establishment of a walking club that has over 350 residents actively enrolled. Other park sites are being considered.
National City	National City	City	59,367	Yes	9.115	Yes	Yes	Yes	Yes	No	The City's PHE focuses heavily on interconnection between public health and disparities in environmental justice. The PHE states "The purpose of this Health and Environmental Justice Element is to identify public health risks and environmental justice concerns and improve living conditions to foster the physical health and well-being of National City's residents." The Element is intuitively laid out, starting with an intro then going into existing settings which goes in-depth regarding current health issues impacting the City, onto Citywide goals and policies, education and public participation, implementation measures, et cetera. National City's PHE provides extensive tables that illustrate policy implementation strategies. A unique aspect of the Element is the fact they include monitoring evaluation tables that describe how the policies would/will be analyzed and evaluated for effectiveness. Further, the tables indicate who the responsible department will be and the relative priority of the policy. Additionally, a subsection (5) is provided which discusses indicators that "the City can use to track its progress towards achieving its vision for the future." These indicators are provided in table form and refer back to the various other Elements mentioned in the GP.
San Pablo General Plan 2030: Ch. 8 - Health	A collaborative effort between the City of San Pablo and Dyett & Bhatia Urban and Regional Planners.	City	29,139	No	2.634 sq mi	No	Yes	Yes; 7 "guiding policies"	Yes; (40)	No	Outside of the actual written content, the PHE is aesthetically pleasing providing informative definitional blurbs and pictures to illustrate concepts and subjects. San Pablo's health element is unique in that it provides a matrix that looks at health element dimensions and other plan elements in terms of relational strength. The PHE is used as a "lens through which to see and understand the importance of all General Plan policies in achieving health-related goals and outcomes."
County of Riverside General Plan GPA 1096: Ch. 10 - Healthy Communities Element	A collaborative effort between the County of Riverside and Dyett & Bhatia Urban and Regional Planners.	County	2,189,641	No	7,207 sq mi (land)	No	No	Yes; 46 policies	No	No	Useful supplemental data can be found in Appendix "M" which goes over socioeconomic, population, transportation, mortality, crime, environmental health and healthcare statistical data.
	Cayucos		2,431	40% Vacation Units	2.1 sq mi						

APPENDIX C: OUTREACH MATERIALS

Cayucos Healthy Community Questionnaire

Date _____
Location _____

This survey is being offered to residents of Cayucos to find out more about the health-related needs of residents. This survey is voluntary and anonymous. You may choose to stop answering questions at any time.

1. Generally speaking, what contributes *most* to your quality of life in Cayucos?
2. What do you think makes it most *difficult* to be healthy or detracts from overall wellness here?
3. What do you think are the most important factors for improving the quality of life in a community? Check (✓) all that apply AND circle three you consider the most important.

☐ Good place to raise children	☐ Affordable housing
☐ Low crime / safe neighborhoods	☐ Arts and cultural events
☐ Good schools	☐ Good jobs and healthy economy
☐ Access to health care (e.g., family doctor)	☐ Healthy behaviors and lifestyles
☐ Parks and recreation	☐ Low death and disease rates
☐ Clean environment	☐ Other _____
4. What do you think are the most important problems with the greatest impact on community health in Cayucos? Check (✓) all that apply AND circle the three you consider the most important.

☐ Aging problems (arthritis, hearing/vision loss)	☐ Heart disease and stroke
☐ Cancers	☐ Infectious Diseases (e.g., hepatitis, TB)
☐ Child abuse / neglect	☐ Mental health problems
☐ Dental problems	☐ Motor vehicle crash injuries
☐ Diabetes	☐ Respiratory / lung disease
☐ Obesity	☐ Drug/alcohol abuse
☐ Domestic Violence	☐ Other _____
5. How would you rate your own personal health? Choose one.

☐ Very unhealthy	☐ Somewhat healthy	☐ Very healthy
☐ Unhealthy	☐ Healthy	
6. What should change in Cayucos that could contribute to your personal health or the health of the community as a whole?
7. What community features, if any, could contribute to the health and quality of life in Cayucos? Check (✓) all that apply AND circle the three you consider the most important.

☐ Additional or improved bike lanes	☐ Better availability of healthy food
☐ Opportunities for community involvement	☐ Additional or improved sidewalks
☐ Improved access to healthcare	☐ Safer neighborhoods
☐ Additional or improved parks	☐ Water fountains/hydration station access
☐ Improved environmental quality	☐ Other _____
☐ Transit options	
8. Do you have any other comments or suggestions?

Cayucos Healthy Community Questionnaire

Demographic Information (participants may want to fill this out themselves)

Sex: M___ F___

How would you describe your ethnicity? _____

Age:

☐ 18 -- 29	☐ 50 -- 59	☐ 80 and older
☐ 30 -- 39	☐ 60 -- 69	☐ Decline to state
☐ 40 -- 49	☐ 70 -- 79	

What is your total annual household income? (Select **one**.)

☐ Less than \$14,999	☐ Between \$45,000 – \$74,999	☐ Decline to state
☐ Between \$15,000 – \$44,999	☐ More than \$75,000	

How many people (including yourself) are in your household? _____

Thank you for completing the questionnaire!

Cayucos Community Health Plan

Thank you for the opportunity to meet with the Lioness Club about community health in Cayucos! We are very interested in learning the opinions of active community members.

What is this project about?

- One of the Health Agency goals is to improve the state of "social and root determinants" of health. These are factors that influence health but have less to do with genetics and more to do with the environment in which we live.
 - The built environment affects health through providing opportunities for:
 - physical activity
 - social interaction
 - access to healthy food
 - minimizing the risk of injury
 - Today the leading causes of death are chronic, preventable conditions.
 - A physical environment that promotes health is an integral part of making our communities healthier.
- Elements of a healthy community include:
- healthy food access
 - safe neighborhoods
 - sustainable and safe transportation
 - parks, recreation, and community facilities
 - healthy economy
 - environmental health
 - medical access

Who is doing the work?

- Jennifer Franich, City and Regional Planning Master's student at Cal Poly, with the help of other students and public health staff.
- This project is a collaborative effort between San Luis Obispo Health Agency, HEAL-SLO, and Cal Poly, San Luis Obispo.

Why am I at the Lionesses?

- The document will seek to address health in planning at the small community level.
- A very important part of this effort is community outreach, and we are seeking input from community groups.

Thank you for taking the time to answer questions and discuss these topics. The information you have provided will be used to develop options for helping to make Cayucos a healthier place.

Cayucos Community Health Plan

Thank you for the opportunity to meet with the PTA about community health in Cayucos! We are very interested in learning the opinions of families and educators in the community.

What is this project about?

- One of the Health Agency goals is to improve the state of "social and root determinants" of health. These are factors that influence health but have less to do with genetics and more to do with the environment in which we live.
 - The built environment affects health through providing opportunities for:
 - physical activity
 - social interaction
 - access to healthy food
 - minimizing the risk of injury
 - Today the leading causes of death are chronic, preventable conditions.
 - A physical environment that promotes health is an integral part of making our communities healthier.
- Elements of a healthy community include:

Key Informant Interview Questions

Name _____ Title/Position _____
Organization _____
Date Completed _____

Topics: Main health concerns, biggest barriers to preventing or addressing health issues, vulnerable populations (children, seniors), existing programs and services, ideas for new programs, services, and partnerships.

Introduction

I'm [name] from the Public Health Department and Cal Poly City and Regional Planning. We are working on a project to [strengthen community involvement to improve health access in our town/county]. An important first step in our effort is to better understand health needs in [Oceano/Cayucos]. To do that, we are conducting interviews with key community leaders.

The themes that emerge from the interviews will be used to inform the final community health plan. While we will use the themes from the interviews, the interviews themselves will be strictly confidential. If you agree, we would list the names of all the people we interview.

Your knowledge would be very valuable and we hope you could make yourself available for in interview. The interview will only take 25-30 minutes. Could we schedule a time to time to meet?

Questions:

1. In your experience, or based on your work with the organization, what would you say are the top 3 or 4 most important health issues in [Cayucos/Oceano].
Probe: Do you think obesity is a problem? Childhood obesity?
2. Are the health issues you mentioned priorities for your organization, or are there any programs in your organization that are related to these issues?
3. How would you describe the overall health of the Oceano/Cayucos community?
Probe: Are there any health issues that seem to be impacting particular groups (children, teenagers, elderly, etc.)? Are there certain neighborhoods or geographic areas that have unmet needs related to active living?
4. Would you consider Oceano/Cayucos a physically active (walking, jogging, biking, swimming, etc.) community?

If Yes:

- a) What types of physical activity do you see people participating in?
- b) Are there specific concentration points for physical activity (i.e. community center, outdoor basketball/tennis courts, etc.)?

If No:

- a) What do you believe is hindering (physical, political, cultural barriers) Oceano/Cayucos residents from being more active?

Examples:

- Absence or inaccessibility of walkways, trails, bike paths.
- Absence or inaccessibility of recreation centers and/or playgrounds.
- Lack of organized sports activities

5. Do you think that food is accessible, available, and affordable in the community?

Probe:

- Explain how it is or is not.
- Are there differences among different groups in the community?
- Are there certain neighborhoods or geographic areas that have unmet needs related to healthy eating?

6. Do you believe there are barriers to enacting policies and creating community support related to active living and healthy eating?

If Yes:

- Who do they represent? (and how representative are they?)
- Why do you think they oppose active living policies?
- Do you think this individual/group is knowledgeable about active living issues?
- In your view, is this individual/group trustworthy?

7. Do you know of any specific “champion” or “champions” for health in the community?

Probe:

- Who do they represent?
- What is their interest in supporting active living policies?
- Do you think this individual/group is knowledgeable about active living issues?
- In your view, is this individual/group trustworthy?

8. Do you think local government funds should be spent to support health policy actions?

Do you have any other comments that you would like to add?

THANK YOU for taking the time to participate in this interview.

Cayucos Community Health Plan

Thank you for agreeing to help gather information about community health in Cayucos!
Contact info: Jennifer's Number: 253-906-3122, Kelly's Number: 310-633-3008

Questionnaire Locations Map

Project Info (for your reference, in case someone you talk to has questions)

- A collaborative effort between San Luis Obispo Health Agency, Health Promotion, and Cal Poly.
- A professional project that satisfies the culminating experience requirement for a Masters student.
- The built environment affects health through providing opportunities for physical activity, social interaction, and access to healthy food, and minimizing the risk for injury.
- Many jurisdictions in California have conducted similar efforts, though none have attempted it with a community as small as Cayucos, or with an unincorporated community.
- These efforts use the existing framework of the general plan, and as such this project will incorporate characteristics of a health element.
- Another similar project is being conducted simultaneously in Oceano.

SCRIPT FOR QUESTIONNAIRE

STEP 1 –Greeting

Good afternoon! Do you have a few minutes to answer some questions about your community?

STEP 2 – Introduce Yourself

We are Cal Poly Students, and we are collecting questionnaires to find out what people think about the quality of life and health in Cayucos.

STEP 3 – Filtering

Are you 18 or older? (If no, let them know that while you value their input, we can't legally include them in the questionnaire pool.) Do you live in Cayucos, or are you visiting? (If they are visiting, we don't want to include the results. but if they live, work, or have family in town, we are interested in that.)

STEP 4 – Disclaimer

This survey should take only 2-3 minutes. The answers will be kept anonymous, and you can stop at any time or choose not to answer any question.

STEP 5 – Ask questionnaire questions.

Note all responses, and include notes if they happen to give you more information than you are directly asking for. It might be very helpful information!

STEP 8 – Thank participants.

Thank you for taking the time to talk to me. The information you have provided will be used to develop options for helping to make Cayucos a healthier place.

	Generally speaking, what contributes most to your quality of life in the city you live					What do you think makes it most difficult to be healthy or detracts from overall wellness here? Open-Ended Response, categorized.

Public Health and Planning in History

- Post Civil War: Era of Industrialization
 - Overcrowding
 - No sewer or sanitation system
 - Epidemic disease

Public Health and Planning in History

- Late 1800s/Early 1900s: Development of Urban Planning and Public Health
- Collect garbage, construct sewers, move people out of the city
- 1930s: Public Health and Urban Planning diverge

How Healthy Are Our Communities?

How do planning and land use decisions affect health?

22.4 percent of CalPERS' medical expenditures in 2008 spent treating chronic diseases that could be prevented through changes in diet and increased physical activity.

(Urban Institute Health Policy Center)

■ Chronic, Preventable Disease
■ Other Medical Expenditures

How do planning and land use decisions affect health?

- healthy food access
- safe neighborhoods
- sustainable and safe transportation
- parks, recreation, and community facilities
- healthy economy
- environmental health
- medical access

Why Cayucos?

- Address social and root causes of health at a small scale, and serve as a model for other small communities
- Will help to inform a larger effort throughout the county
- Improve social and root determinants of health

Questions?

Group Questions

- What are the top 3 contributors to the health of the Cayucos community?
- In your experience, what are the top 3 most important health issues in Cayucos?
- What solutions might you propose to increase physical activity, healthy eating, or to address other "root determinants" of health?

APPENDIX D: OCEANO COMMUNITY HEALTH PLAN

OCEANO COMMUNITY HEALTH PLAN

INTRODUCTION

One of the primary goals of both the San Luis Obispo County Public Health Department and the Health Commission is to enhance the quality of life for all people living in communities throughout the County. As public health advocates, they have acknowledged the need to address the many chronic diseases and preventable health conditions which stem from unhealthy diets and sedentary lifestyles. They have recognized there is a multitude of contributing factors that can impact an individual's health status, including the built environment, access to healthy food sources and opportunities for physical activity and recreation, all of which are aspects of community design that fall under the purview of the planning profession.

**San Luis Obispo County
Public Health
Department**

**Health Promotion
DRAFT | June 2014**

Over the course of the past two decades, a reintegration of public health and city planning professions has been occurring. Health departments have realized that without changes to particular physical determinants of health, behavioral changes cannot be influenced and risk factors contributing to chronic disease cannot be controlled.¹ Being such, health departments have begun collaborating with planners in an effort to bring forth changes to community design and land use development that impact the built environment.

Figure 1 – Framework for Understanding the Social Determinants of Health

Source: Bay Area Regional Health Inequities Initiative

This planning document, modeled after health elements currently being included in general plans throughout California, will integrate the fields of planning and public health to provide Oceano an assessment of its residents' health, a description of the current built environment conditions that may be hindering physical activity and access to nutritious food sources, as well as establish goals, policies and action programs that will set a course of action toward a healthier Oceano community.

ACKNOWLEDGEMENTS

This plan was designed and authored by Phillip Brennan, Masters Student in City and Regional Planning at California Polytechnic State University San Luis Obispo, in partial fulfillment of a Master of City and Regional Planning degree. He also served as the graduate planning intern at the Health Promotion Division of the San Luis Obispo County Public Health Department. Jennifer Franich, also a graduate intern, assisted with the crafting of the plan. The project with developed under the direction of Professor Kelly D. Main, PhD. Dr. Main chaired the professional project committee, which also included Kathleen Karle, Director of Health Promotion at the San Luis Obispo County Health Agency, and Chuck Stevenson, lecturer at Cal Poly in City and Regional Planning and former Planning Director for the County of San Luis Obispo.

Thanks to the San Luis Obispo County Public Health Department and County Health Commission, the City & Regional Planning Program at California Polytechnic State University San Luis Obispo, Healthy Communities Work Group, HEAL SLO, Oceano Advisory Council, Oceano Community Service District, S.A.F.E. Oceano, Dignity Health’s Promotores Collaborative, and the Oceano Community Farmers’ Market, whom all contributed in some regard to the development and promotion of this document.

COMMUNITY HEALTH GOALS

The Oceano Community Health Plan was purposed with the idea of improving the health of Oceano's residents by promoting policies that help create a built environment that encourages physical activity, increases health equity, fosters social interaction, safety and overall wellness. The following community health goals are a synthesis of the concerns, desires and needs expressed by the community:

- GOAL 1: **Improve the overall health and wellness of Oceano residents** by promoting policies, collaborations, partnerships and education programs that seek to increase physical and mental wellness cross-culturally across all age groups.
- GOAL 2: **Enhance the built environment** so that it acts as a catalyst for active living behaviors, through land use patterns and urban design strategies.
- GOAL 3: **Make Oceano a physically active community** by creating an active transportation network that places an emphasis on safe, accessible and well-connected pathways to commercial, residential and recreational destinations throughout the community.
- GOAL 4: **Increase the provision of parks, recreation facilities, green and open spaces** by exploring all feasible avenues that may lead to additional areas/space for physical activity, recreation and relaxation, and providing safe and efficient access to these destinations.
- GOAL 5: **Make Oceano a healthier place** by providing safe and easy access to a full range of primary, preventative, and specialty healthcare facilities that can screen, treat and educate community members.
- GOAL 6: **Make Oceano a nutritious food environment** by increasing access to affordable and nutritious foods/beverages by supporting community-oriented healthy food sources, such as farmers' markets, community gardens and food banks.
- GOAL 7: **Make Oceano a safer place** by providing street illumination, expanding walking and bicycle networks, increasing traffic calming infrastructure, and encouraging zoning that balances compatible land uses, as well as urban design strategies that enhance visibility and natural surveillance.
- GOAL 8: **Make Oceano a well-informed community** by promoting cross-cultural preventative health and awareness education, and supporting organizations that provide alcohol and tobacco prevention and cessation programs/classes.

HEALTH & THE BUILT ENVIRONMENT: a historical perspective

City planning and public health in the United States has held a long and intertwined relationship which dates back nearly 150 years. “The emergence of urban planning as a profession and academic discipline had its basis in nineteenth century public health initiatives, including tenement housing reforms, the construction of urban water supply and sewerage systems, and the design of parks and playgrounds.”² Due to the burgeoning industrialization and urbanization of the time, major American cities of that day were the antithesis of sanitary and healthy environments. Overrun with human and animal waste, trash and general squalor, major cities were breeding ground for infectious diseases such as yellow fever, cholera, typhoid and tuberculosis. Further, toxic air pollution and run-off from nearby industrial sites, ventilation and lack of clean water sources made living in a city a health risk. Planners utilized physical interventions to respond to the many urban health crises of that era.³

By the 1930s, many of the primitive health issues had been resolved. Advancements in research and technology led to the understanding of diseases being biological in nature instead of environmental.⁴ The two disciplines began to drift into their own separate fields of practice. Public health became the domain of science and medicine focused on controlling and identifying the causes of infectious diseases. City planning became primarily concerned with urban form, land use, growth and zoning. This divergence would continue on unto nearly the end of the century.

During the past 20 years, there has been a reconnection between the fields of planning and public health. The infectious disease epidemics of the late nineteenth and early twentieth century are now primarily gone in our country. Today, the battle is dealing with chronic and preventable diseases.

According to the Centers for Disease Controls and Prevention (CDC) website, chronic diseases are the leading causes of death and disability in the United States.⁵ As defined by the World Health Organization (WHO),

chronic diseases are “diseases of long duration and generally slow progression,”⁶ which include heart disease, stroke, cancer, chronic respiratory diseases and diabetes.

The 2013 Chronic Disease Prevention Framework report published by the California Conference of Local Health Officers and County Health Executive Associates of California states the following:

A growing body of research links these chronic diseases to specific risk factors—such as obesity, smoking, poor nutrition and physical activity—which are strongly influenced by economic and education levels, social norms, and the physical environment.⁷

Mounting research has shown a strong correlation between the built environment and its effect on public health. “The designated use, layout, and design of a community’s physical structures including its housing, businesses, transportation systems, and recreational resources affect patterns of living (behaviors) that, in turn, influence health.”⁸ The decisions we make regarding aspects of planning such as land use, vehicle circulation, zoning and street design are all elements that influence human behavior; the level of physical activity (i.e. walking, bicycling and recreation) we receive; the amount of time we spend in our cars driving; the foods we consume (fast foods vs. fresh markets); the quality of air we breathe—all act as contributing factors to our health.

RELATIONSHIP TO OTHER PLANNING DOCUMENTS

The Oceano Community Health Plan will serve to strengthen policies that acknowledge the connection between health and the built environment. It will guide programming, funding, and future development toward a more health-conscious environment. The plan helps to address health where it is not fully addressed elsewhere in the County's General Plan. San Luis Obispo County area plans describe specific land use policies and categories that determine uses, density and intensity for specific portions of the county. They specify development standards for public services, circulation and land use, as well as programs for correcting local problems or conditions.

San Luis Bay Coastal Area Plan

Oceano, along with Pismo Beach, Grover City, Arroyo Grande, Halcyon, and the urban area of Avila Beach, comprise the San Luis Bay Planning Area. The San Luis Bay Coastal Area Plan (last revised in August 2009) describes the land use policies for the Coastal Zone portion of the San Luis Bay Planning Area, as well as defines allowable density and intensity and specific development standards meant for addressing issues unique to the individual communities.⁹

The Plan does not contain any explicit promotion of public health related goals or policies in reference to Oceano. In fact, the term "health" is never used in the document in the context of providing benefits for, or the protection of, public health purposes. However, some of the language used throughout the document does have public health supporting implications.

The San Luis Obispo County's General Plan provides recommendations for programs or policies found in the San Luis Bay Coastal Area Plan that have potential public health ramifications. Specifically, one of the Oceano Urban Area Program recommendations is for the County Engineering Department to work in conjunction with property owners and LAFCo in an

effort to bring urban street improvements such as curbs, sidewalks and street trees, to residential areas.¹⁰ These improvements could provide increased pedestrian mobility and enhance the aesthetic appearance within the neighborhood, which can both act as catalysts for provoking physical activity.

The Land Use section provides the following public health impacting recommendation “a neighborhood park site should be reserved in the easterly portion of the community to better meet resident needs.”¹¹ Though, it should be noted the recommendation makes no connection between parks or green spaces and the benefits to public and mental health.

In Chapter 4: *Circulation*, the Plan states “the planning area will likely continue to be automobile-based, but alternative components of the circulation system such as transit, bikeways and air traffic will be important components of the area wide circulation system.”¹² Recommendations for improved bikeways, “Bike lanes as wide 8 feet, or separated Class I bikeways, are needed on such roadways as [...] along Highway 1 from Pismo Beach through Oceano [...] Class II or III bikeways are recommended on Highway 1 from Oceano onto the Nipomo Mesa”¹³ are mentioned for future improvement projects. The potential health and environmental benefits of increasing bike ridership is not mentioned.

Oceano Specific Plan

The Oceano Specific Plan was adopted by the San Luis Obispo County Board of Supervisors in 2002, and certified by the California Coastal Commission in 2004. The Specific Plan’s purpose is to provide “an overall framework for translating broad community values and expectations into specific strategies for enhancing the community’s quality of life.”¹⁴ The concerns addressed in the Specific Plan were informed by Oceano residents through information collected via surveys, meetings and public workshops. The Specific Plan is meant to be used in conjunction with the San Luis Bay Area Plan.

The Specific Plan places an emphasis on safety, sidewalks, bicycle infrastructure, park, open spaces and recreational facilities, as demonstrated by one of the Specific Plan's four defined primary goals, Oceano's future community designs will feature "Improved buildings, public spaces, pedestrian walkways, safe bikeways, more natural areas, parks and high quality landscaping."¹⁵ Indeed, the concept plan for Oceano's downtown is a pedestrian oriented, mixed-use commercial retail development. As detailed in the literature review section of this report, the provision of these built environment features are associated with inhibiting physical activity behaviors, and therefore may yield potential health benefits. There is also implicit acknowledgment that parks, public open spaces and plazas provide intangible beneficiary value by fostering social activity, interaction and community cohesiveness,¹⁶ all of which research has shown to be associated with improved mental well-being.

While many of the goals, programs, land use regulations, development standards and design guidelines stated in the Specific Plan would have corresponding positive health impacts, it is generally not described in the document as the overriding motive. Rather, the outlined development strategies are meant to be "used as a promotional tool, to acquaint potential developers with Oceano's economic potential and the expectations of its residents."¹⁷ Nevertheless, from a health perspective, the plan does provide new development standards and programs that will serve to help Oceano residents.

Oceano Revitalization Plan

The County of San Luis Obispo in partnership with the Local Government Commission from the California Department of Transportation, and funded by an Environmental Justice Planning Grant, created the Oceano Revitalization Plan, with work beginning in 2012. The Revitalization Plan builds off of the 2002 Oceano Specific Plan and seeks to employ actions that will implement policies outlined in the Specific Plan. The Revitalization Plan lists three objectives:¹⁸

1. Identifying improvements that will lead to a safer and more walkable downtown and adjacent neighborhood areas,
2. Planning for improved mobility, and
3. Creating more attractive streetscapes along Highway 1 to enhanced retail activity and jobs

Whereas the Oceano Specific Plan sees improvement of sidewalk infrastructure and connectivity as a necessary step to encourage new development in Oceano, the Revitalization Plan makes a clearer connection between the health benefits of providing such amenities. For example, the Revitalization Plan states “Frequent bicycle racks along the street corridor are another necessity for promoting healthy community living and easily enabling alternative modes of transportation.”¹⁹

Public safety is also a primary concern that is addressed in the plan, as both short-term (crosswalk striping, bike lane restriping) and long-term (street medians, roundabouts, lane reductions) enhancements are identified as strategies to improving pedestrian, bicyclist and motorist safety. Improvements in traffic safety and connectivity remove fear barriers and increase opportunities to be physical active.

Other County General Plan Elements

Other goals and policies that apply to Oceano are described in the County of San Luis Obispo’s General Plan.²⁰ The General Plan is the blueprint for the future physical, economic and social development of the unincorporated areas of the County, outside cities. It implements California laws that regulate land use planning and development. State law requires that every general plan must contain the following components or “elements”: Land Use, Conservation, Noise, Circulation, Open Space, Safety and Housing. In addition, state law allows for the adoption of additional or optional elements of a general plan. The County of San Luis Obispo has adopted seven optional elements: Recreation, Historic and Esthetic, Energy, Off-shore Energy, Economic and Agriculture. It should be noted the Governor’s Office of Planning and Research has begun its 2014 update of the *General Plan Guidelines*. Along with an

extensive overview of the required general plan elements, it will also focus on four key areas: Economics, Equity, Climate Change, and Healthy Communities.²¹

SUMMARY OF COMMUNITY OUTREACH

Several efforts were made to connect with the community prior to and throughout development of this document. The goal of the outreach effort was to garner valuable perspective and feedback from community members regarding physical activity levels, information about the built environment where they live, work, and play, and perceived barriers to healthy activities and food access. Efforts included key informant interviews with informed members of the community, a widely-distributed survey questionnaire, meetings with local family and social service groups, a planning activity with students at Oceano Elementary, visits to community events such as the Oceano Farmers' Market meeting and Day of the Child event, and presentations to the Oceano Advisory Council and Community Service District. Outreach results aided in constructing goals, policies, and action programs that will meet the specific needs of the Oceano community. Results are included in the following section, Health and Wellness context, and contributed to creating a more complete picture of community health in Oceano.

HEALTH & WELLNESS CONTEXT

The Health & Wellness Context section describes health concepts that relate to city planning, the built environment and public health. Background information is provided regarding existing conditions and issues found in Oceano that relate back to those concepts, helping to inform and provide rationale behind the goals, policies and action programs later outlined in this document.

Oceano's status as an unincorporated, census-designated place meant certain community-level health data was not available. In these cases, regional county-level data from the 2013 ACTION for Healthy Communities project was utilized,²² with Oceano and the communities of Arroyo Grande, Halcyon, Grover Beach, Nipomo, Pismo Beach, and Shell Beach being represented in the "South County" area data. Additionally, project studies involving specific segments of Oceano's population were used, providing some relevant data findings which helped to inform this plan.

Chronic Diseases

Chronic disease is the leading cause of early morbidity and mortality in California.²³ Inequalities in life expectancy and health outcomes due to chronic disease are associated with income, education, and ethnicity.²⁴

During a three-year (2008-2010) recorded span, the leading causes of death in Oceano were cancer, diseases of the heart and chronic lower respiratory diseases (i.e. asthma, chronic bronchitis, emphysema,

and other lower respiratory illnesses).²⁵ These health conditions commonly stem from obesity, poor nutrition and sedentary lifestyles. Oceano's younger-than-average median age (35.4 years old) could act as an impending risk factor, due to younger residents going undiagnosed while living prolonged unhealthy lifestyles. This factor compounded with the Oceano's low-socioeconomic (SES) status and lack of access to health and preventative care facilities puts residents of the community at higher risk for developing and diagnosing chronic and preventable health issues.

Obesity & Physical Activity

The health benefits of regular physical activity, even at moderate levels, are well-documented and established.^{26 27} Physically active lifestyles, among other benefits, can help regulate weight, reduce rates of chronic and preventable diseases, raise lung capacity, improve mental well-being and increase life expectancy.²⁸ Despite the many benefits of active living, obesity rates in the U.S. for adults have doubled and rates for children have tripled since 1980.²⁹

Each year, the California Department of Education requires all public school students in grades five, seven and nine to participate in a Physical Fitness Test (PFT).³⁰ The PFT measures six categories of physical fitness to assess whether the child scores in the Healthy Fitness Zone® (HFZ). Children that score in the HFZ are said to have sufficient fitness for good health, at a level which offers some degree of protection against diseases that typically result from inactive lifestyles.

The 2012-2013 PFT results of Oceano Elementary fifth graders were alarming.³¹ Only 48.8 percent of Oceano students tested in the HFZ for body composition and fitness levels; the lowest figure of all the tested schools in San Luis Obispo County. Further, 34.4 percent of the students scored in the *Needs Improvement (NI) – Health Risk Zone*; the highest percentage in the county. The NI – Health Risk Zone is an indicator that suggests “if the student continues to track at this level there is a clear *potential* for future health problem (a *more probable* risk).”³²

Inferences may be drawn from these results as the percentage (29 percent) of time spent (> 10 hours per week) by South County children on screen time (computer, television, videos, texting) has increased from 2010 levels,³³ which may be an indication that children in Oceano are spending less time doing physical activities in favor of sedentary behaviors.

No statistical data was available regarding obesity rates of Oceano adults. However, county-wide data indicates an improving trend, as 48.1 percent of adults in the County were overweight or obese (BMI > 25), indicating a significant drop from the previously surveyed results of 59.2 percent in 2009.³⁴

A community survey conducted in Oceano provided insight into residents’ perceptions of their own personal health levels. Half of the all respondents viewed themselves as “somewhat healthy.” Perhaps even more revealing was the fact one quarter of respondents deemed their personal health as “unhealthy” to “very unhealthy” [see Figure 2].

During interviews, community stakeholders who work closely with Oceano families suggested a lack of nutrition education and cultural barriers may be contributing to poor health outcomes; notions of nutrition and physical activity for health purposes are unfamiliar concepts for many first generation families, and therefore these concepts are not being imparted to younger generations.

Figure 2 – Perceptions of Personal Health

Land Use & Community Design

The role of the built environment, which is “defined broadly to include land use patterns, the transportation system, and design features that together provide opportunities for travel and physical activity,”³⁵ has been identified by practitioners in both the urban planning and public health fields as a determinative factor influencing active living behaviors. Well designed land use can create an environment that fosters physical activity. Land use policy through zoning can affect a community’s design, allowing for, or prohibiting certain types of uses. This regulatory power can help support public health by restricting unhealthy uses such as liquor

retail stores or fast food restaurants in certain locations.

Mixed land use is one approach planners have been successfully utilizing to create attractive, compact developments that promote active transportation and social interaction. Mixed land use reduce travel distances by locating origins and destinations in close proximity to one another, allowing for “linked” destination points that can be undertaken in one trip. Studies have suggested individuals living in communities with higher density, connectivity and land use mix reported higher rates of pedestrian and bicycling activity versus those from less dense, poorly networked, single land use neighborhoods.³⁶

Mixed use neighborhoods should include a diverse mix of uses, including various dwelling types, home businesses, child care centers, schools, medical centers and public open space that promote walking or cycle trips.

In addition to the potential health benefits, commercial and residential mixed use developments offer increased economic, employment, entrepreneurial and housing opportunities for residents living within the community, which can be attractive incentives for impoverished communities. This community health plan supports the mixed-use project design found in the recently adopted Oceano Revitalization Plan, which propose vertical mixed-use residential units on top and commercial (or offices) spaces on the bottom floor.³⁷

Active Transportation Network

Active transportation defined is “physical activity that is done primarily for the purpose of moving from one destination to another, usually by walking or bicycling.”³⁸ These types of travel modes are facilitated by the provision of complete, safe and accessible sidewalk and bikeway infrastructure. Community design that places an emphasis on integrating pedestrian and bicyclists into its transportation network have higher rates of walking and biking as a result.³⁹

Efficiently connected bike and pedestrian networks can reduce reliance on short-trip automobile use, providing the added benefits of monetary savings (fuel expenditure), as well as environmental ramifications by lessening air pollutants that contribute to green house gases and poor air quality. Further, research has shown communities with high rates of bicycle usage have lower rates of auto-related accidents due to drivers being more cognizant of their surroundings while driving.⁴⁰

Oceano’s SES profile comports with research findings that indicate “access to recreation facilities, quality and safety of pedestrian facilities, and aesthetics are poorer in areas with mostly low-income and racial or ethnic minority populations.”⁴¹ Oceano’s pedestrian network is severely disconnected presently. Residential areas surrounding Oceano Elementary are without consistent sidewalk surfaces, are in poor condition and lack safety amenities such as street lamps that provide added security at night. Some streets, particular those nearest the elementary

school, have sidewalks on just one side, or none at all. These factors along with a failure to provide connected, intuitive and efficient access to primary destination points in the town are major impediments to eliciting active lifestyle behaviors.

This community health plan fully supports the stated goals expressed in both the Oceano Specific Plan and Oceano Revitalization Plan, which seek to improve and enhance sidewalk and bicycle infrastructure in the town.

Parks, Recreation & Open Spaces

Parks, recreation and open spaces are vital outlets for exercise, recreation, leisure, relaxation and overall wellness. Multiple studies have related proximity to parks and recreation facilities with increased levels of recreational physical activity.^{42 43 44} Additionally, research studies have shown being in contact, or in the very least, in sight of natural environments has beneficial effects on our mental health.⁴⁵

According to the Urban Land Use Map for the South County Planning Area, there are three areas, totaling 25 acres, which are designated for recreational land use purposes.⁴⁶ Of those areas, Oceano Memorial Park (County Park) comprises the largest portion of acreage. However, the actual acreage area may be less due to the fact a significant portion of the space is devoted to camp grounds, as well as another section designated as a Sensitive Resource Area, rather than providing surfaces (i.e. grass, trail, soft surfaces) that can be used for recreational purposes.

Approximately a half acre of land is designated as Open Space on the eastern side of Oceano. However,

no changes were proposed for this space in the Oceano Specific Plan. This is likely due to permitting, easement, and parking issues related to the location (encompassed by residences) and narrow linear dimensions of the space.

The grass fields at Oceano Elementary have long served the community as an unofficial recreation space. Community members are widely known to “jump” the fence to gain access and use of the space. This is indicative of the need for publically accessible recreation spaces; a desire voiced in the community survey [see Figure 3] when asked “What should change in Oceano that could contribute to your personal health or the health of the community?” Grouped answers related to parks, recreation centers and playgrounds came up as the most commonly mentioned response type.

Figure 3 – Features that Would Improve Personal or Community Health

In light of research studies that have linked disparities in access and park distribution in communities similar to Oceano, proximity maps [see Figures 4 & 5 on p. 15] have been provided which mark the location of currently existing outdoor park and recreation areas in Oceano. Oceano Elementary is included as an

outdoor space for the previously aforementioned reason. The colored overlays represent the areas in distance via street network (quarter-mile and half-mile) each location serves. The second map adds a proposed park in the east side of Oceano and indicates the potential increased area it would serve.

Figure 4 – Existing Outdoor Park and Recreation Facilities in Oceano Proximity Map

Figure 5 – Proposed Outdoor Park and Recreation Facilities in Oceano Proximity Map

Access to Healthy Affordable Foods

Access to fresh produce and nutritious food sources is critical to maintaining a healthy diet which can reduce the risk of obesity and diet-related diseases. Conversely, the lack of access to affordable and healthy food options can be determinant to negative health outcomes.

Larger chain supermarket food stores have shown to be more likely to offer healthy food options at reduced costs than smaller non-chain type markets. There is an association between race and economic status with low-income neighborhoods having fewer chain supermarkets than middle-income neighborhoods, and the availability of chain supermarkets in Hispanic neighborhoods being only 32 percent of what is found in non-Hispanic neighborhoods.⁴⁷

Planners can help reduce the inadequacies in the food system as food production, access, transport and distribution are subjected to land use regulations. Land use planning and zoning initiatives regulate what types of businesses can be built within a particular planning area. For example, ordinances have been used to create healthier environments by restricting businesses such as fast food restaurants and tobacco vendors from being built within a certain distance from school or recreational areas. Ordinances have also been used to provide allowance for the creation of urban garden districts where community members can grow and harvest fresh produce and natural herbs.

Oceano does not have a chain supermarket within its borders. Three small markets, La Tapatía Market and Deli, Central Market and Johnson’s Market serve the community, with only one vendor participating in the Women, Infants and Children (WIC) supplemental nutrition program. Key informant interviewees mentioned the excellent selection of fresh produce at certain markets, but also noted many residents preferred the larger selection and affordability of certain foods available at Vons, located in Grover Beach, just over a mile from the most northern border of Oceano.

Two food access proximity maps are provided on the following page. The first [see Figure 6] map provides the location of “healthy” food outlets; stores with a moderate to wide variety of fruits and vegetables, whole grain bread and reduced fat milk. The second map [see Figure 7] plots the location of “non healthy” retail food outlets; stores lacking the aforementioned healthy food options, instead offering a predominance of prepackaged, highly processed, high sugar and fat, less nutritious food options. Both maps provide a colored overlay which represent the areas by distance via street network (half-mile to mile) each location serves.

The maps illustrate that most of the community is adequately served by markets that sell healthy foods. The food outlets that sell less healthy food options are clustered close together in the commercial downtown corridor, and therefore are less accessible to a large part of the community.

Figure 6 - Healthy Food Access Proximity Map

Figure 7 - Unhealthy Food Access Proximity Map

Access to Hydration Stations

A major contributor to the obesity epidemic is found in the empty calories consumed daily from sugar-sweetened drinks, which include non-diet sodas, fruit drinks, smoothies and any other beverage that uses sugar as a primary additive. One study found that replacement of sugary beverages could cut up to 235 calories per day for the average American child's intake.⁴⁸

Table 1 – Water vs. Sugar Sweetened Beverages

Type of Beverage	Calories in 12 ounces	Calories in 20 ounces
Fruit punch	192	320
100% apple juice	192	300
100% orange juice	168	280
Lemonade	168	280
Regular lemon/lime soda	148	247
Regular cola	136	227
Sweetened lemon iced tea (bottled, not homemade)	135	225

(USDA National Nutrient Database for Standard Reference)

Water is the healthiest calorie-free alternative to sugar-sweetened beverages (see Table 1) and provides numerous health benefits such as weight management, reduces the risk of dental caries, and boosts the immune system. Despite the added benefits, research has indicated both children and adults are not consuming the recommended daily intake of water (8-12 8 oz. glasses per day).⁴⁹

Many planning departments across the country have begun addressing this health issue by incorporating policies into their general/comprehensive plans that recommend providing hydration station (i.e. drinking

fountains) amenities at public parks and facilities. Code ordinances are being used to require the provision of hydration stations for certain types of development.

Oceano presently has no hydration stations available in the community. Oceano Elementary has drinking fountains on the school grounds, but is not officially made accessible to the general public. The provision of publically accessible hydration stations in the community serves a practical need, but can also act as a symbolic gesture of the municipal government's interest in the well-being of its residents.

Air Quality and Respiratory Health

The built environment, with specific regard to roadways, traffic patterns and exposure, has critical implications for local inhabitants in regard to air pollution exposure. "Motor vehicles contribute to more than 50 percent of air pollution in urban areas."⁵⁰ Carbon monoxide, nitrogen dioxide, and particulate matter (PM) are all common auto-related air pollutants which in increased levels can be respiratory irritants that can aggravate existing asthma and other respiratory conditions. Community design that includes active transportation networks, mixed land uses, and efficient mass transit systems can help decrease auto dependency and reduce air pollution.

The San Luis Obispo Air Pollution Control District (APCD) monitors particulate matter and ozone in the air. Long-term exposure to high concentrations of PM and high ozone levels (smog) pose a health danger by increasing the risk of cardiovascular and respiratory harm.⁵¹ PM is measured at two levels, 2.5 microns or

less in diameter (PM2.5) and 10 microns or less (PM10). These size particles can penetrate the lungs and cause harm. In 2012, zero days exceeded the California ozone standards, down from 5 days in 2006. There was an estimated 3.1 days in 2012 when the PM2.5 exceeded the national standard, up from 0 days in 2006.⁵²

Though it was not expressed by the community during the course of conducting the various aforementioned outreach activities (see p. 9), air quality concerns stemming from dust plumes coming off of sand dunes at nearby Oceano Dunes State Vehicle Recreational Area (SVRA) has historically been a known concern.

In 2012, the APCD conducted the South County Community Monitoring Project, for the purpose of mapping the extent, concentration level, and impact of dust plumes in Nipomo Mesa and Oceano neighborhood areas.⁵³ Results from temporary monitoring stations indicated elevated PM concentration levels in Oceano, typically during times of high northwesterly winds, at locations near areas of open disturbed sand, such as those found in Oceano's SVRA and near the park entrance on Pier Avenue. However, these levels were found to diminish dramatically over a short distance downwind and were deemed limited in spatial extent and impact.⁵⁴ The findings corroborated with data collected from previous short-term monitoring conducted in 2011, which found no windblown dust impacts were measured at centrally located Oceano Elementary School.⁵⁵

According a recent survey of fifth grade students from schools belonging to the Lucia Mar School District, 24

percent of students responded that a parent or other adult told them they have asthma, and 17 percent reported having trouble breathing when not exercising.⁵⁶

Access to Health Care

Due to many of the risk factors summarized in the previous sections, low-income, ethnic minority populations are groups most prone to incurring negative health outcomes.⁵⁷ High rates of unemployment, education levels, limited transportation options, lack of insurance coverage and fewer health and medical care facilities are compounding issues which limit access to health care.

The percentage of county residents with health insurance and those with a regular source of healthcare has decreased since 2010.⁵⁸ In 2013, 77.9 percent of South County residents reported having health insurance, with 28.2 percent receiving insurance through a state or federal program such as Medicare or Medi-Cal. These figures are likely not accurately representative of Oceano, as the rates of unemployment, residency status and income are prohibitive for many residents to obtain health coverage. Support for this assumption may be deduced from ACTION face-to-face survey results which found 75 percent of Spanish-speaking respondents in the county were uninsured in 2013.⁵⁹

The Community Health Centers clinic, located along Highway 1 next to Central Market, did provide low-cost medical, dental, chiropractic services, as well health education and specialty care, but has recently since closed its doors. This has subsequently left a health care service vacuum in the community.

Through land use controls and zoning, planners can help dictate the facility use of specific locations. Additionally, initiatives can be provided that allow for variances within a designated land use as deemed necessary, relative to the community's need.

Safety

Walking is the most common form of physical activity in the United States and one of the most affordable and resource efficient forms of travel (Litman, 2014).^{60 61} The ability to walk is especially important in disadvantaged communities where walking to a destination (or to a transit stop) such as place of employment, grocer, healthcare facility or park is the only means of arriving to these locations.

If not dictated by necessity, there are many contributing factors that may dissuade individuals to walk for physical activity or recreational purposes. Multiple research findings have indicated feelings related to personal safety and security were behavioral motivators which help determine whether community residents will be physically active.⁶² The perceived threat of violence or crime in certain neighborhoods can impact decisions to walk for leisure, exercise or even necessity.⁶³

Gangs, crime and drug activity are unfortunately an inherent part of many socio-economically disadvantaged communities. Negative perceptions associated with these types of activities were voiced repeatedly by Oceano community members during outreach events and responses from the community survey.

Figure 8 – Community Features Most Important to Oceano

Survey respondents were asked (see Figure 8 above), “What community features, if any, could contribute to the health and quality of life in Oceano?” They were instructed to first checkmark all the answer choices that applied, and then to prioritize three answer choices they felt were most important by circling them. More than half of all respondents which answered the question valued “safer neighborhoods” over additional or improved bike lanes or park facilities.

During a spatial mapping exercise with Ocean Elementary sixth graders, the question was asked “where do you feel unsafe in Oceano?” Some students specifically noted areas around 15th and 19th Streets as being locations where “scary people” and “gangsters” were (see Figure 9 on next page). The need for more police was also mentioned.

Figure 9 – Spatial Mapping Exercise

Similar sentiments (see Figure 10 below) were provided by Oceano adults that visited the Healthy Communities booth at the Day of the Child event held in April 2014, at the Oceano Community Center. A large paper scroll was provided and visitors were asked to write down things they thought would make Oceano a better place.

Figure 10 – Community Suggestions on Paper Scroll

Common responses were “más seguridad [...] más luz en las calles [...] menos miembros de pandillas [...] las calles están muy oscuras, necesita más iluminación” [translated to English: “more security [...] more lights in the streets [...] less gang members [...] the streets are very dark; need more light”].

Land use and transportation planning, along with urban design can help curb community violence and increase positive perceptions of safety. In addition to dedicated bike lanes and sidewalks, traffic-calming features such as bulb-outs, raised crosswalks, and speed bumps can reduce the speed of auto traffic near schools and residential areas, in turn promoting safe walking and biking experiences.

Research has indicated that crime rates are influenced by building design and land uses.⁶⁴ Mixed-use developments which typically place residences above retail/commercial spaces put “eyes on the streets,” dissuading illicit activities, as does providing clear sight lines and street lamps that allow residents to see and be seen, helping to illuminate the dark areas within the community.

GOALS, OBJECTIVES, POLICIES + ACTION PROGRAMS

The goals, objectives, policies and action programs outlined in this section are intended to address Oceano's key health issues and challenges, and were developed for the purpose of fostering an environment that will promote physical and mental health wellness for all community members.

OCHP GOAL 1: IMPROVE THE OVERALL LEVEL OF PHYSICAL HEALTH AND MENTAL WELLNESS IN OCEANO

Objective

Establish protocols, procedures and collaborations that produce positive health outcomes for Oceano residents

POLICIES

- P. 1.1** Prioritize the health of Oceano residents; particularly for the most vulnerable groups in the population
- P. 1.2** Incorporate health considerations and implications in all policies, programs, decisions and development activities when applicable
- P. 1.3** Promote and encourage community participation during open forums at local government public meetings
- P. 1.4** Collaborate with external partners, such as the San Luis Obispo County Public Health Department (SLOCPHD), Lucia Mar School District, and other non-profit, social service groups and local government agencies in making health a priority for the community
- P. 1.5** Promote an understanding of the connections between the built environment and public health challenges in Oceano

ACTION PROGRAMS

- A. 1.1** All community development project proposals, permit applications, zoning and amendment requests shall be routed to the SLOCPHD's Healthy Communities Workgroup to be reviewed for potential public health impacts.
- A. 1.2** A collaborative review of the County's General Plan with staff from the SLOCPHD and San Luis Obispo County Planning and Building Department should be established to identify opportunities to incorporate health promoting policies in future General Plan amendments.
- A. 1.3** SLOCPHD should develop and define health indicators and methods to track, monitor and collect community-level health data to better understand the health issues specific to Oceano
- A. 1.4** Initiate discussions with the San Luis Obispo Air Pollution Control District to explore the feasibility of adding a permanent monitoring station within or in close proximity to the Oceano Community Service District boundary

OCHP GOAL 2: A BUILT ENVIRONMENT THAT AFFORDS PEOPLE OF ALL AGES AND ABILITY THE OPPORTUNITIES AND BENEFITS OF BEING PHYSICALLY ACTIVE

Objective

Promote land use patterns and urban design to create an environment that encourages active living, promotes social interaction, and improves overall wellness

POLICIES

- P. 2.1** Recreational facilities and parks should be easily accessible to all Oceano residents, emphasizing pedestrian, bicycle, and transit accessibility

- P. 2.2** New development should be encouraged to provide healthy public spaces into the project
- P. 2.3** Compact, mixed commercial/residential development should be encouraged in the downtown commercial corridor
- P. 2.4** Encourage development strategies that will increase the amount of park, trails, open spaces and green spaces should be developed
- P. 2.5** To the greatest extent possible, the community should be designed and developed in such a way to provide safe, easy and efficient access for the disabled

ACTION PROGRAMS

- A. 2.1** Develop street design guidelines for the commercial downtown area, providing guidance on improvements to the public right of way through complete street principles including: narrow roadways; bike lanes; on-street parking; enhanced crosswalks; street trees; way-finding signage; public art; and other features that may contribute to the desired character of the town
- A. 2.2** Develop and adopt a minimum street design standards for both residential and commercial street design features that will facilitate walking and biking opportunities in new developments
- A. 2.3** Ensure existing minimum density standards are upheld for new development projects
- A. 2.4** Identify opportunities for mixed-use development that achieves additional community benefits such as improving neighborhood aesthetic, recreation opportunities, affordable housing, live-work units, and public art space
- A. 2.5** Enhance the commercial downtown corridor by co-locating services and retail next to each other, allowing for residential on top of commercial mixed-use spaces, and providing attractive and walkable retail nodes

OCHP GOAL 3: A PHYSICALLY ACTIVE COMMUNITY

Objective

Increase opportunities for physical activity throughout the community

POLICIES

- P. 3.1** Support the development of safely accessible, clearly marked, walkable paths to the beach and County Park should be sought
- P. 3.2** Support regional efforts to increase cycling as a viable transportation alternative
- P. 3.3** Support the development of regularly scheduled, low-cost events and programs that encourage physical activity
- P. 3.4** Increase bicycle amenities such as bike racks or storage lockers in the commercial downtown area
- P. 3.5** Create a network of intuitively connected, continuous, efficient, and safe pedestrian and bicycle pathways
- P. 3.6** Direct policy efforts to make active transportation the primary mode of travel within the town's borders
- P. 3.7** Prioritize the creation of a continuous, safe and attractive pedestrian and bike network as a community strategy
- P. 3.8** Provide amenities such as bike lockers or racks to encourage bicycle use
- P. 3.9** Prioritize infrastructure upgrades that improve pedestrian and bike safety closest to the school

ACTION PROGRAMS

- A. 3.1** Develop a joint-use (or shared-use) agreement with the Lucia Mar School District and the County to allow use of Oceano Elementary's sports field after hours as a cost-effective strategy to increase opportunities for physical activity.

- A. 3.2** Establish a community program which specializes in low-cost recreation alternatives such as temporary parklets or monthly *cyclovias* events. A *cyclovia* (or *ciclovia*) is a Spanish term for “cycle way,” and are events in which sections of public roads are shutdown and made into temporary bike paths and recreation areas.
- A. 3.3** Establish a “bike kitchen” run by volunteer community members, providing tools and maintenance instruction to keep bikes functioning and in use, and creating opportunity for social cohesion
- A. 3.4** Traffic light timing will provide pedestrians, particularly the elderly, disabled and those pushing strollers, sufficient cross times
- A. 3.5** Develop a bike rack donation and dedication program

OCHP GOAL 4: ADEQUATE, SAFE, AND ACCESSIBLE PARKS AND RECREATION SPACES FOR THE COMMUNITY

Objective

Increase the provision of quality parks, recreation facilities, green and open spaces in Oceano

POLICIES

- P. 4.1** Recognize that parks and public recreation spaces are critical components for an active and healthy community
- P. 4.2** Ensure that parks and public recreation spaces are equally distributed and safely accessible within Oceano
- P. 4.3** Support the use of turning long-standing vacant lots into small parks, open spaces or community gardens

ACTION PROGRAMS

- A. 4.1** Seek sponsors to subsidize costs of using the Oceano Community Center, making it available to all residents
- A. 4.2** Explore the feasibility of increasing the land use and acreage of land dedicated to recreation and open space, as specified in the county general plan
- A. 4.3** Develop community garden regulations specifying appropriate design, maintenance and operation requirements which will provide a starting point to creating said gardens
- A. 4.4** Create an incentive program that will provide property owners of vacant lots reduced property taxes for use of the land
- A. 4.5** Evaluate the feasibility of developing new smaller neighborhood pocket parks in areas of most need
- A. 4.6** Develop and promote regularly scheduled community and cultural events which make use of County Memorial Park
- A. 4.7** Work with the Oceano Community Service District to explore feasibility for property owners in Oceano to help defray expenses for maintenance of neighborhood parks through small increase in property tax

OCHP GOAL 5: ACCESSIBLE HEALTHCARE

Objective

Ensure all community members have safe and convenient access to a full range of primary, preventative, and specialty health care

POLICIES

- P. 5.1** Encourage new health care facilities to locate in Oceano
- P. 5.2** Support the use of mobile health care services to increase access within the community
- P. 5.3** Encourage the development of a complete care center; co-locating various medical, physical and mental health care services together
- P. 5.4** Enhance and promote the relationships with local private hospital and medical groups, and public organizations that provide health and wellness programs in the community

ACTION PROGRAMS

- A. 5.1** Investigate the feasibility of incorporating a one-step electronic application process for enrolling qualified applicants into a public benefit programs
- A. 5.2** Create a developers' incentives program to help recruit medical and health care providers into Oceano, offering reduced or waived permit fees and discounted property taxes
- A. 5.3** Create development guidelines that would require health care facilities to be readily accessible by pedestrians, bicyclists, motorists and transit-dependent members of the community
- A. 5.4** Support state licensed residential care programs that provide 24-hour non-medical care for children, adults and the elderly

- A. 5.5** Partner with SLOPHD to provide technical assistance to aid local organizations that deliver health and social services to seniors, homeless persons, low-income community members, and other groups with special needs

OCHP GOAL 6: A HEALTHY, AFFORDABLE AND ACCESSIBLE FOOD ENVIRONMENT

Objective

Increase accessibility, availability and affordability of fresh, locally grown foods for Oceano residents

POLICIES

- P. 6.1** Partnerships between local merchants and the community farmers' market should be encouraged to increase the availability of healthy food choices in the community
- P. 6.2** Improve opportunities for nutritious food options by encouraging a mix of food establishments in the commercial corridor
- P. 6.3** Promote the production and distribution of locally grown food by reducing barriers to farmers' markets, food cooperatives and community food gardens
- P. 6.4** New commercial, retail and mixed use development should provide pedestrian and bicycle access and amenities such as bike racks
- P. 6.5** Support the use of vacant private and public lots for community gardens as deemed feasible and appropriate
- P. 6.6** Public transit routes should be directed to stop at or near food market locations, in an order to provide greater community access to grocery outlets

ACTION PROGRAMS

- A. 6.1** Develop a local ordinance that requires farmers' markets utilizing public streets or sidewalks, to accept EBT payments. This requirement would allow many low-income residents access to healthier food options.
- A. 6.2** Provide an expedited permitting and licensing process for food vendors selling unprocessed, nutritious foods
- A. 6.3** Provide permitting incentives to retailers who accept WIC and EBT payment; provide an assistance program to help businesses
- A. 6.4** Develop a Healthy Food Vendor program that recognizes food establishments which sell primarily unprocessed, locally grown or harvested foods
- A. 6.5** Create a Hydration Station program to seek opportunities for funding through grants or donations to provide hydration station/drinking water units across Oceano

OCHP GOAL 7: A SAFE AND SECURE COMMUNITY

Objective

Create an environment where residents and visitors feel safe in their surroundings

POLICIES

- P. 7.1** Improve street illumination in residential areas
- P. 7.2** Increase visible pedestrian, bicycle, and traffic signage
- P. 7.3** Continue to support and participate in the program efforts of the Safe Routes to Schools (SR2S) program, prioritizing their findings for infrastructure improvements

- P. 7.4** Support the use of traffic-calming features near the commercial downtown corridor and near the elementary
- P. 7.5** Invest in Oceano's youth (working age individuals) by providing opportunities to gain experience learning marketable skills
- P. 7.6** Support the increase of peace officer staff and patrols in the community

ACTION PROGRAMS

- A. 7.1** Create commercial and mixed-use development standards which apply Crime Prevention Through Environmental Design (CPTED) principles into planning and design strategies to enhance public security and safety
- A. 7.2** Develop a job development or apprenticeship program with interested local businesses and organizations that will partner with local youth organizations such as the Oceano Boys & Girls Club, S.A.F.E. Family Resource Center, and Arroyo Grande High School Student Support Center, connecting youths that have a to develop skills, volunteer or find summer work, providing them personal finance training.
- A. 7.3** Seek grant funding to aid developing or enhancing community crime prevention, gang control, and youth mentorship programs
- A. 7.4** Inquire about requirements and seek funding from eligible grant programs such as the Energy Efficiency and Conservation Block Grant and the Community Facilities Grant
- A. 7.5** Work with OCSD and County Department of Public Works to seek and secure funding for increasing the number of street lights in neighborhoods.

OCHP GOAL 8: A WELL-INFORMED COMMUNITY

Objective

Prioritize health, nutrition and preventative education for all ages

POLICIES

- P. 8.1** Opportunities to educate local social-service, family and community groups on preventative healthcare training should be sought by SLOCPHD
- P. 8.2** Partnerships should be sought with healthcare providers and organizations to promote programs that reduce dependence on drugs, alcohol and tobacco
- P. 8.3** Informational and health promotion materials should be developed and encouraged to be distributed at public facilities and private businesses within the community
- P. 8.4** Collaborative partnerships should be developed with local and regional agencies of relevant interest to promote health education

ACTION PROGRAMS

- A. 8.1** Develop an arrangement between the SLOPHD and the Oceano Community Center to allow scheduled regular use of the facilities to teach free disease and preventive health education, as well as drug, alcohol and tobacco cessation classes
- A. 8.2** Develop a Public Participation Program aimed at educating community members about their public participation rights, providing schedules to local advisory body meetings for opportunities to engage with community decision makers
- A. 8.3** Investigate the development of joint-use agreements with Lucia Mar School District to utilize classroom and library facilities for free community after-hour health and nutrition education classes
