

Development of Bluebeam Curriculum for Construction Management Department in Virtual and In-Class Transmissions

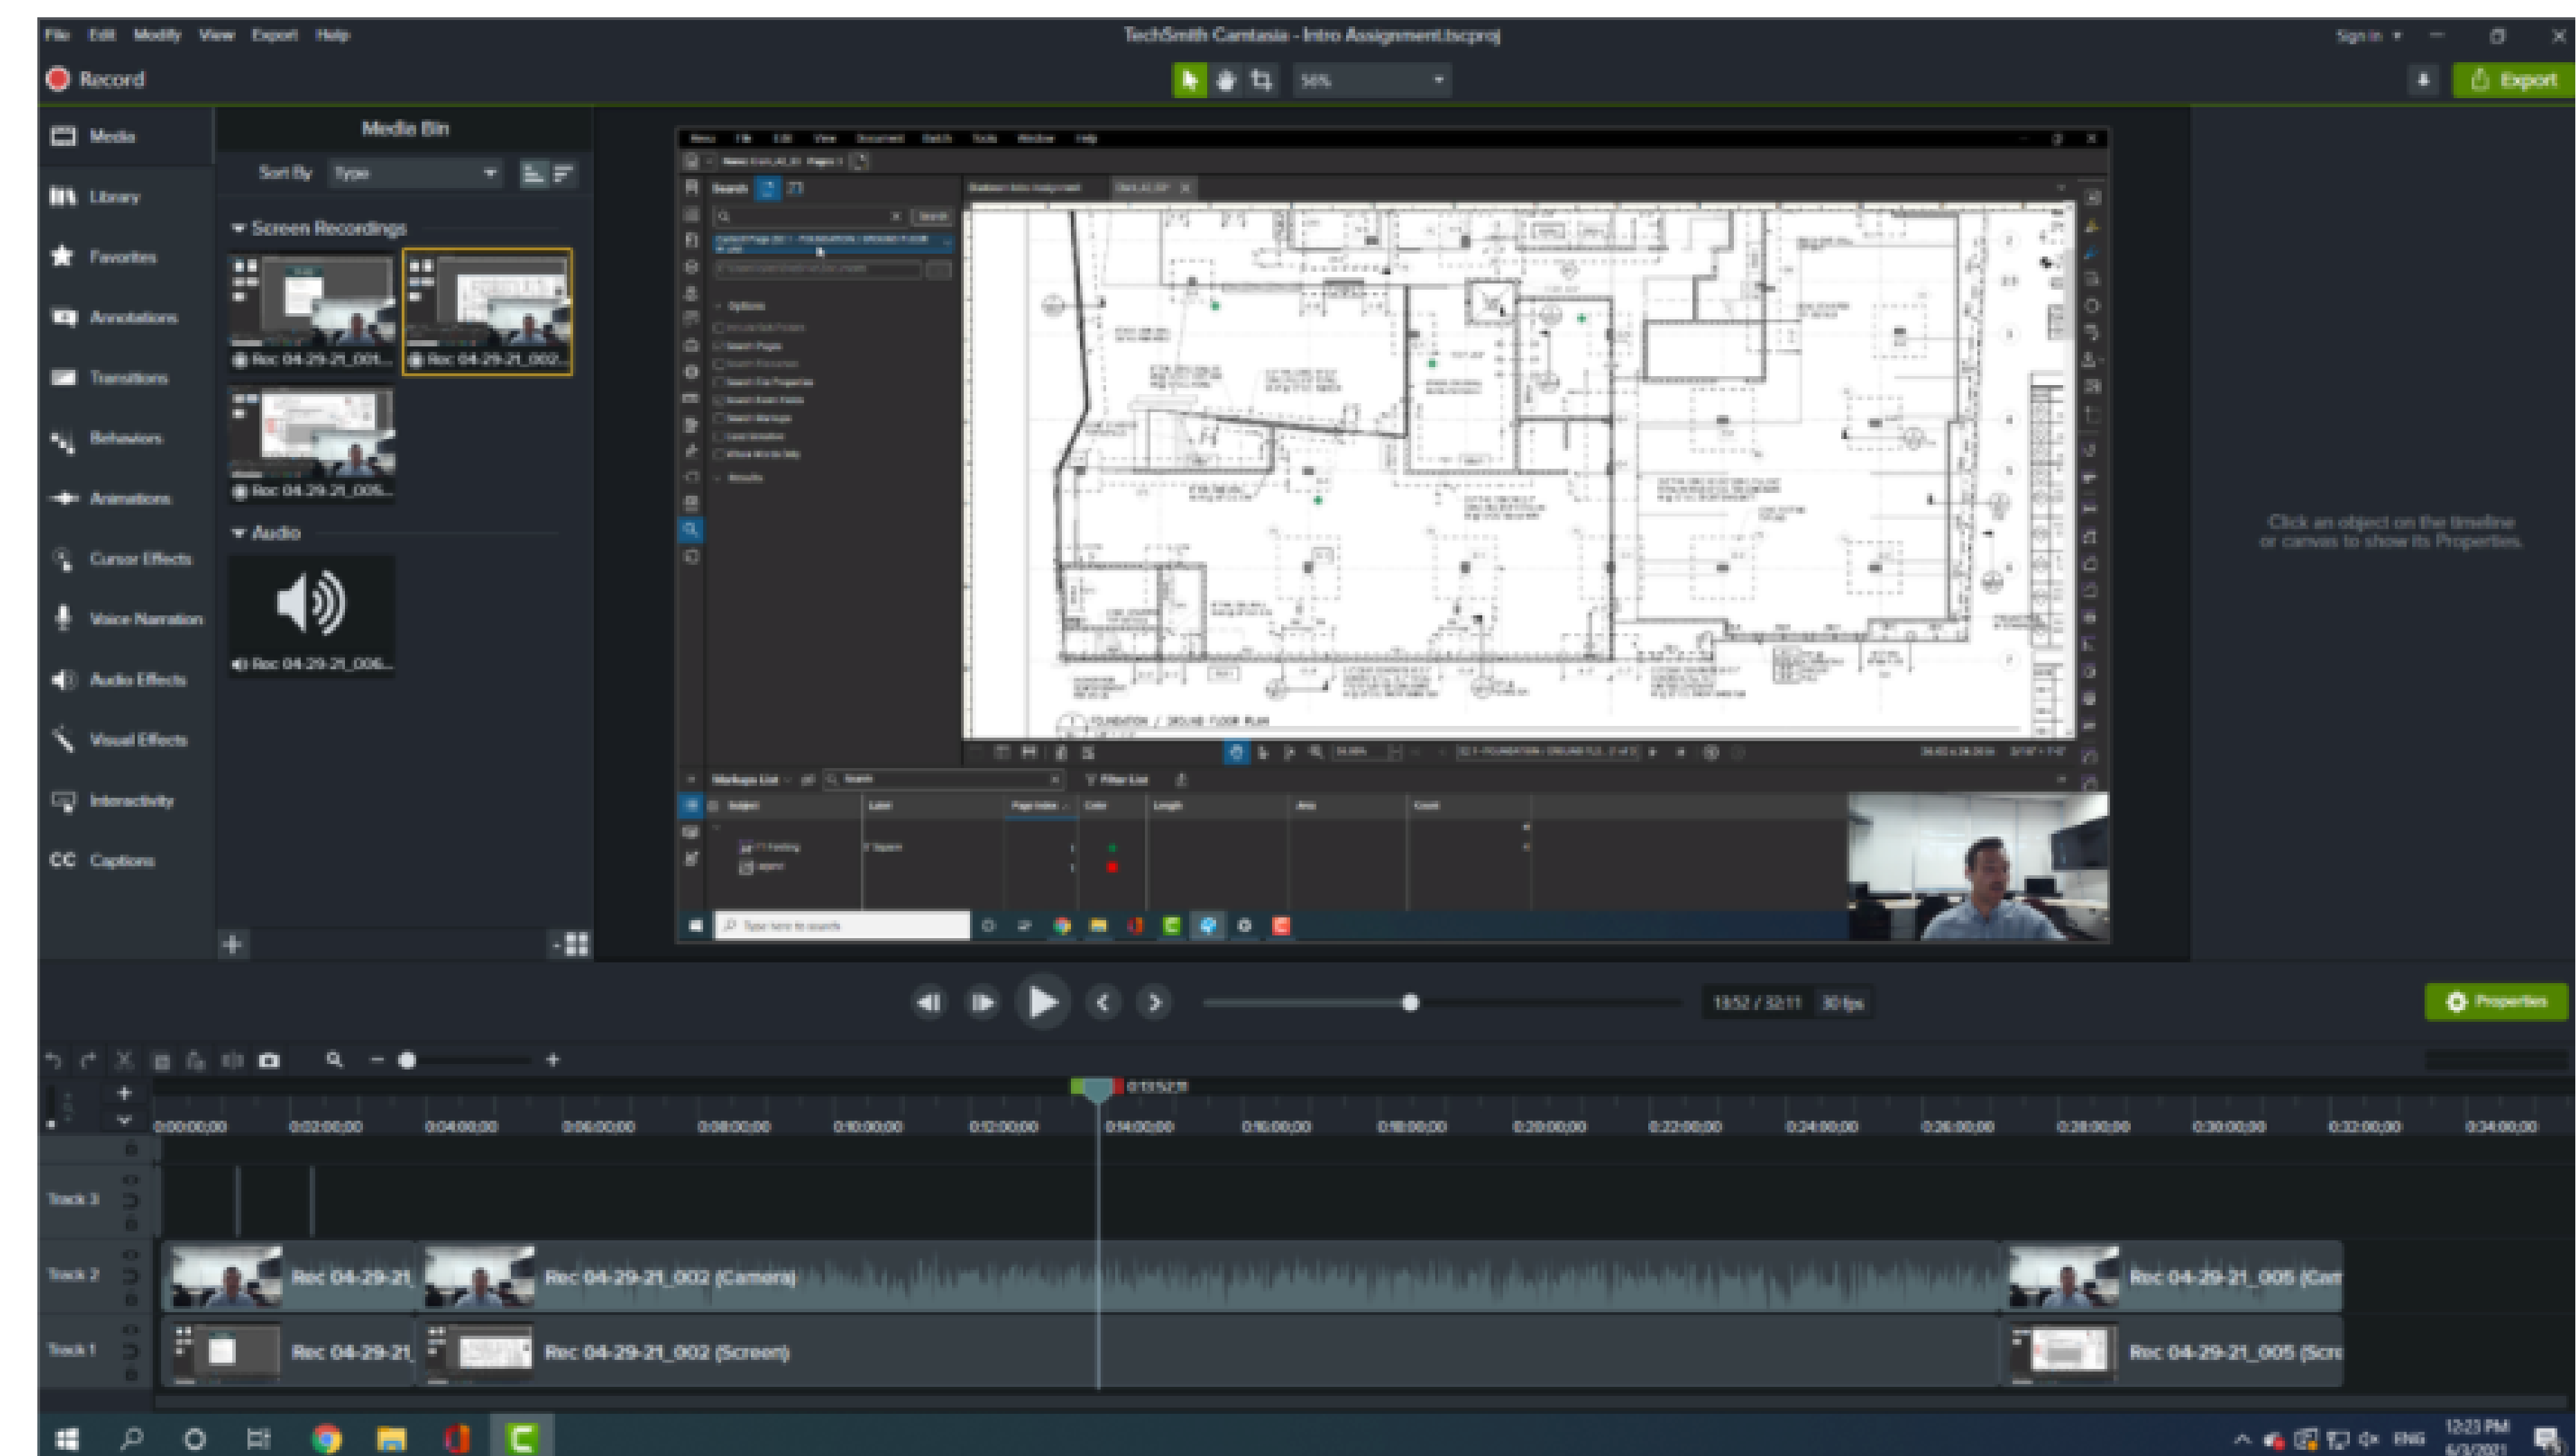

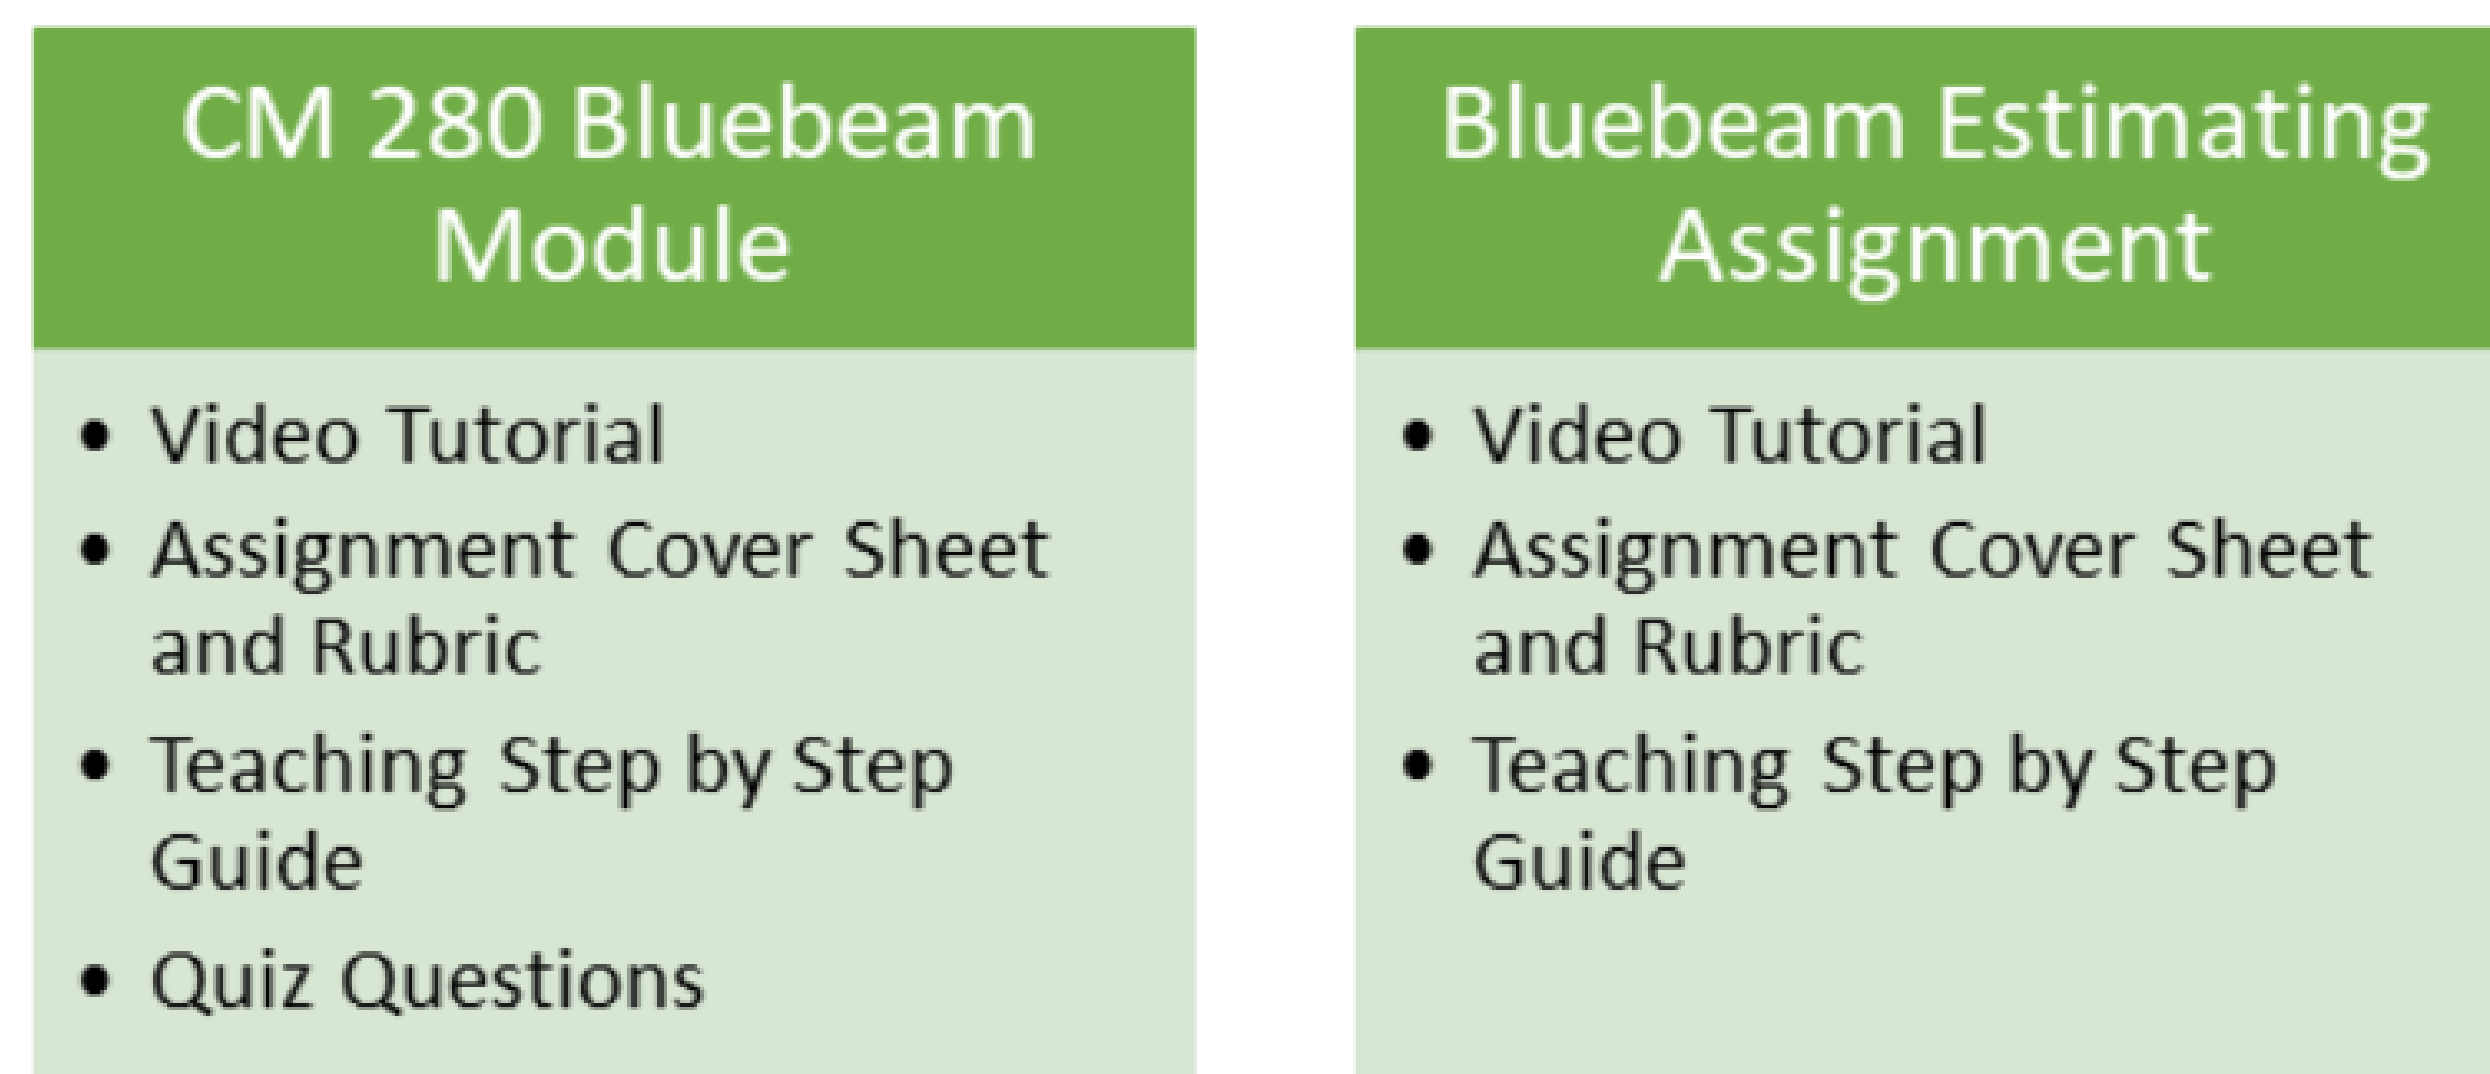

Development of two new learning modules for the Cal Poly Construction Management department on Bluebeam practices and usage that reflect industry and technological changes. Adapting to and maintaining practices in distance learning, this curriculum allows for optimal online education and further advancement and clarity in in-person transmissions. With step-by-step videos for optional distance learning, students and faculty can choose to engage in alternative modes of education delivery. Building on traditional roles of construction technology education, teaching instructions are provided for faculty. This project based senior project positively impacts the body of knowledge available to students and faculty at Cal Poly in relations to construction technology.
