None Like It In His Country

"We have nothing like this in Iran," said Dr. Mohammad Mahdavi, right, as he discussed student-owned beef projects without feed. On any occasion for Dr. Mahdavi, leader in Iran agricultural education, was impressed by the quality and presentation of the Santa Barbara beef. Dr. Mahdavi was brought to Cal Poly to tour the Agricultural College's facilities with Dr. Edgar Hyer, Head of Poly's Agricultural department, Dr. Mahdavi was interested in the student-owned projects and was impressed by the quality and presentation of the Santa Barbara beef.

They're Working Their Way Through

More than a fourth of the students at Cal Poly have been working full-time jobs this year. These students are working off-campus, doing odd jobs in the city, or working on campus for less than a full-time load. A report prepared by the Department of Housing and Residence said that 25% of all students worked last year. Currently, the report states that 25% of all students are working part-time jobs. Students working at least ten hours per week have reported an average of 20 hours per week in off-campus jobs. These students are working at various odd jobs in the city, such as yard work, odd jobs, or working for a local business. Off-campus jobs are often less than a full-time load and do not report average hours.

Summer jobs and part-time work are important to many students, especially those who are working off-campus. Many students have found that the demand for off-campus jobs is greater than the supply of available jobs, and many students have had to work long hours to earn enough money to cover their expenses. Many students have found that the demand for off-campus jobs is greater than the supply of available jobs, and many students have had to work long hours to earn enough money to cover their expenses. Two MB Photographers Hit In Travelling Exhibit

Eleven of the traveling picture empezerl exhibition from the TCU Photographic Club is to be shown this week.
Where's Wilf?

Editor: What has happened to the literary critic's column? Last week's editorial column was underwritten by Grip Page. This week the editor has disappeared. Could it be that he is writing a new book and he has no time to form his opinions on the TCU student body.

It could be that I should have noted this fact, but since I did not know it to begin with, I cannot make any conclusions. Since I have not received any mail support for this column, I can only assume that the editor is working on something more important.

He told all as it may, I predict another collapse in his world, and in attempts at humor, humor.

Hairy Chests?...

Dear Editor:
The summer weather is here now, and in Cal Poly language that means "beach time."

Good enough. I can go along with that. But do these people actually have to come into the cafeteria with the bare minimum of clothing on their bodies? I wonder if this ever occurred to some of those so-called nude playboys that some people don't actually enjoy getting across the table from a hairy chest.

It's a known fact that students disapprove of the cafeteria uniforms being worn by those who are considered "nude playboys." And what do students think of the cafeteria uniforms? They are furiously against them, to say the least.

The 97 pound weakling is not interested in wearing anything without a shirt. I don't think requiring men to wear a T-shirt would be doing too much for them.

The 97 pound weakling

1E Major Wins Tool Engineer Scholarship

Jesse L. Craven, Junior Industrial Engineering major at Cal Poly, was the recipient of the 1951 Annual Mansfield Award from the American Society of Tool Engineers.

To qualify for this award, Craven was required to submit a paper on the field of tools, production or manufacturing. In addition, he had to maintain an "excellent grade point average" to demonstrate his qualifications.

Small Car Parking...

Ever been looking for a parking space—discover one—then find it is already taken by a small foreign car? This, no doubt, has happened to many of us—every one who drives the small foreign car.

"It is disturbing. Would it not be possible to have a couple of separate parking lots as a mark for the "little ones"? Perhaps one could utilize two regular sized parking stalls in the same parking lot. When a car, which has as many smaller cars as this, we are using quite a lot of valuable parking space. The approximate average length of a normal parking space is 20 feet, while the approximate length of a Volkswagen, for example, is 19 feet. This, we say, on the average, an ordinary college pupil is 5 feet 11 inches tall.

"It is quite a simple matter to have, in the various parking lots on campus, an area set aside for the smaller cars. It is on the front lot on the Science Building—why not set aside a part of this lot for small cars and smaller cars? Or in some of the staff car-parking areas, these could be marked with the lines closer together, in addition to having a shorter guard rail (those high ones are transfer on those tiny bumpers). Then, the Volks, Renault's, Consul's, MOV, Porsche's, and all the rest would be able to " dive" into their own little spaces. These areas, of course, would be "off limits" for the Detroit "macho" drivers.

Simple reasoning is all it takes to understand the problem—if there are fifty small cars parked about the campus (and we are sure there are many more) and each small car wastes about six feet of space, that is a grand total of 300 feet—simply useless. In that 300 feet it would be possible to park 15 big cars or 25 big small cars.

The smaller cars, we feel, design car drivers on their cars—and appreciate how they feel about their sports cars having a very valuable place in this economy-minded society. Also, it is our belief when the drivers of the small cars are looking for a place to park, they dearly hate to park between two "monsters." The bumpers of most small cars are usually not built to withstand the crunch administered by those big cars. Not *we are sure there are many more) and each small car wastes about six feet of space, that is a grand total of 300 feet—simply useless. In that 300 feet it would be possible to park 15 big cars or 25 big small cars.

The larger cars, we feel, design car drivers on their cars—and appreciate how they feel about their sports cars having a very valuable place in this economy-minded society. Also, it is our belief when the drivers of the small cars are looking for a place to park, they dearly hate to park between two "monsters." The bumpers of most small cars are usually not built to withstand the crunch administered by those big cars. Not only that, but the small car bumpers are considerably lower and WVV there a feeder and/or headlight.

We think it would be advantageous of both small and large cars, to campaign for this kind of system. We are sure it would save a lot of headaches on both sides. We, and we believe you, don't want to be faked out completely on the small car parking.
